ns on the portal. However, during state workshop and ore data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department Nagar nigam Jhansi
Urban Local Body	For Park and Recreation Related Questions	Udyan vibhag Nagar nigam Jhansi
Urban Local Body	For Water Supply and Drainage related questions	Jal Nigam/Jalkal vibhag Nagar nigam Jhansi
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB
Urban Local Body	For Ecological sites related data	Forest Department Jhansi
Urban Local Body	For Housing related data	Jhansi Development Authority / Nirmaan Vibhag Nagar Nigam Jhansi
Urban Local Body	For Building plan related data	Jhansi Development Authority Jhansi
Urban Local Body	For Roads related data	Public Works Department / Nirmaan Vibhag Nagar Nigam Jhansi
Urban Local Body	For Solid waste management related data	Health Department Nagar Nigam Jhansi
Urban Local Body	For IT services related data	Computer Department. Nagar Nigam Jhansi
Urban Local Body	For Vendor committee related data	District Urban Development Agency(DUDA) Jhansi
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District urban development Agency Jhansi
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh pollution Control Board Jhansi
Development Authority	Building Infrastructure	Moradabad development Authority Jhansi
	Construction planning	Moradabad development Authority Jhansi
	Green Building	Moradabad development

available as supportive

nts/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 40 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**2**

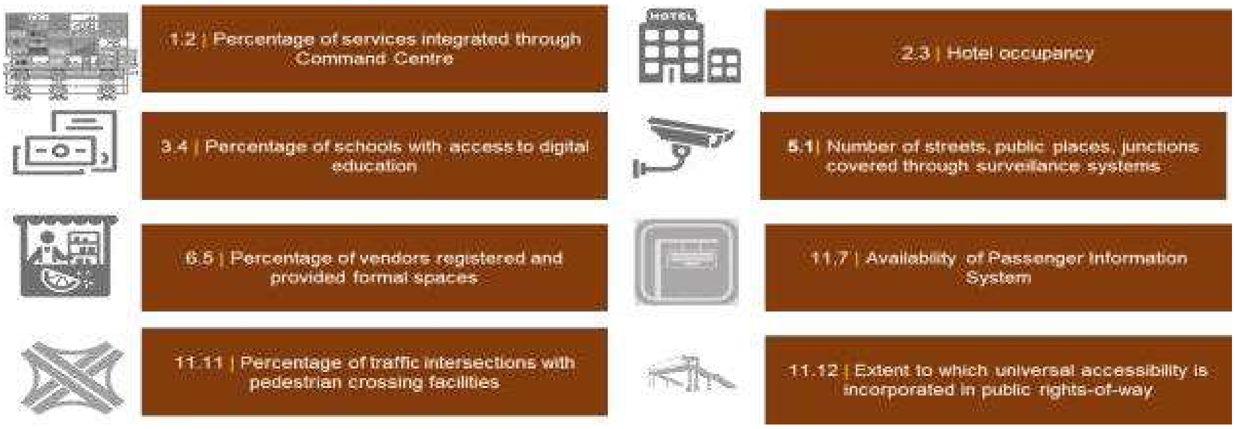
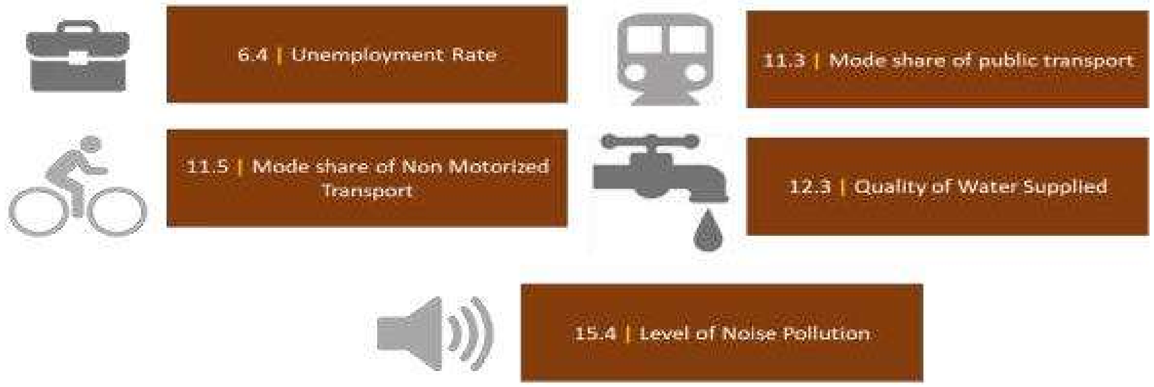
prising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre
2.3 | Hotel occupancy
3.4 | Percentage of schools with access to digital education
5.1 | Number of streets, public places, junctions covered through surveillance systems
6.5 | Percentage of vendors registered and provided formal spaces
11.7 | Availability of Passenger Information System
11.11 | Percentage of traffic intersections with pedestrian crossing facilities
11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate
11.3 | Mode share of public transport
11.5 | Mode share of Non Motorized Transport
12.3 | Quality of Water Supplied
15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

ative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

le platform to understand and discuss the methodology and

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

physical audit and primary data collection, citizen survey was n and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

Your complimentary use period has ended. Thank you for using PDF Complete.
PDF Complete
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not prcjected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

Your complimentary use period has ended. Thank you for using PDF Complete.
Click Here to upgrade to Unlimited Pages and Expanded Features

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

		Total number of households covered through door-to-door collection of solid waste	14674
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	108
		Daily average quantum of waste water treated by STPs in the city (MLD)	70
	Electricity	Total number of authorized electrical connections in the city	239271
		Total electricity supplied to the city (kWh)	16541.51
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	...
	Roads and Transport	Total Length of Road Network in the City (Km)	1595
		Total length of arterial and sub-arterial road network in the city (Km)	...
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

ory Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	**Category**	**Indicators**
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Development		**Indicators**
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Development		Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

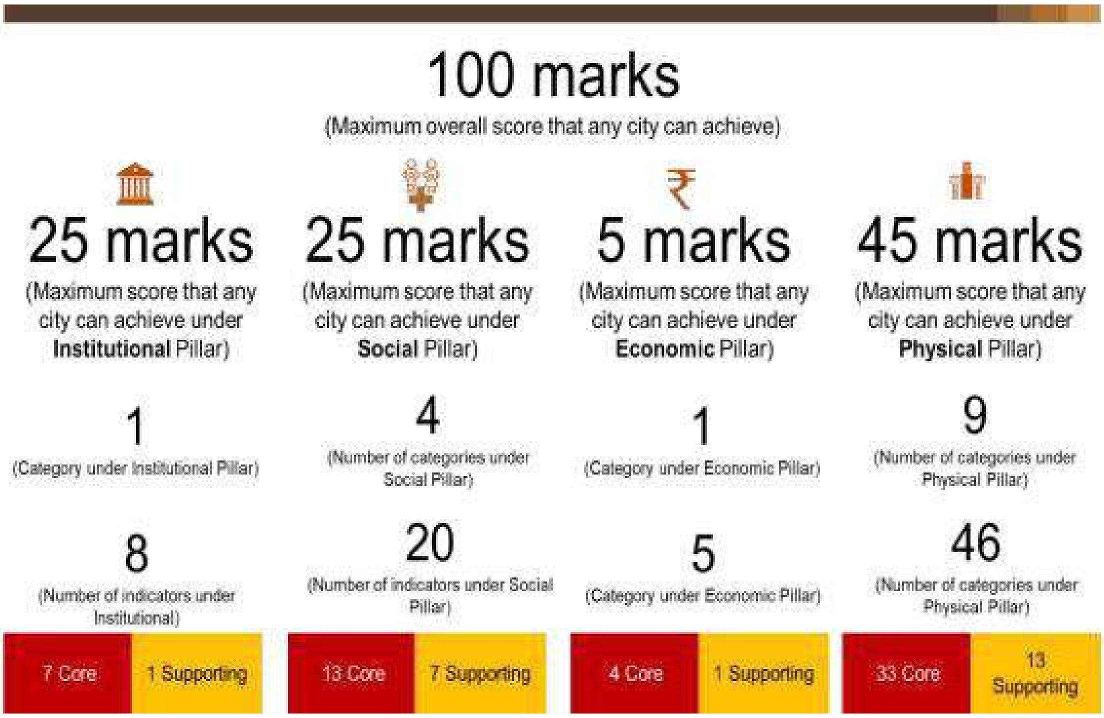
3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

es broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Section, Jodhpur Nagar Nigam
Urban Local Body	For Park and Recreation Related Questions	Town and Country Planning department
Urban Local Body	For Water Supply and Drainage related questions	Public Health and Engineering Department
Urban Local Body	For Heritage sites related data	Jodhpur Nagar Nigam
Urban Local Body	For Ecological sites related data	Jodhpur Nagar Nigam
Urban Local Body	For Housing related data	Jodhpur Nagar Nigam
Urban Local Body	For Building plan related data	Jodhpur Development Authority
Urban Local Body	For Roads related data	Jodhpur Nagar Nigam, Jodhpur Development Authority and Public Works Department
Urban Local Body	For Solid waste management related data	Jodhpur Nagar Nigam
Urban Local Body	For IT services related data	Oswal Data, Jodhpur Nagar Nigam
Urban Local Body	For Vendor committee related data	Jodhpur Nagar Nigam
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Jodhpur Nagar Nigam
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Central Pollution Control Board

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 32 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	**Number of Documents**
Sales and Commercial Taxes	2
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	3
State Health Department	1
Transport Authority	9
Disaster Management	0
Urban Local Body	14
Total	32*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

indicator from the Institutional pillar, one from the Social five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

upport and support extended by MoHUA. The state level epartments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

tated the process by conducting video conferences with the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

		Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

		Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

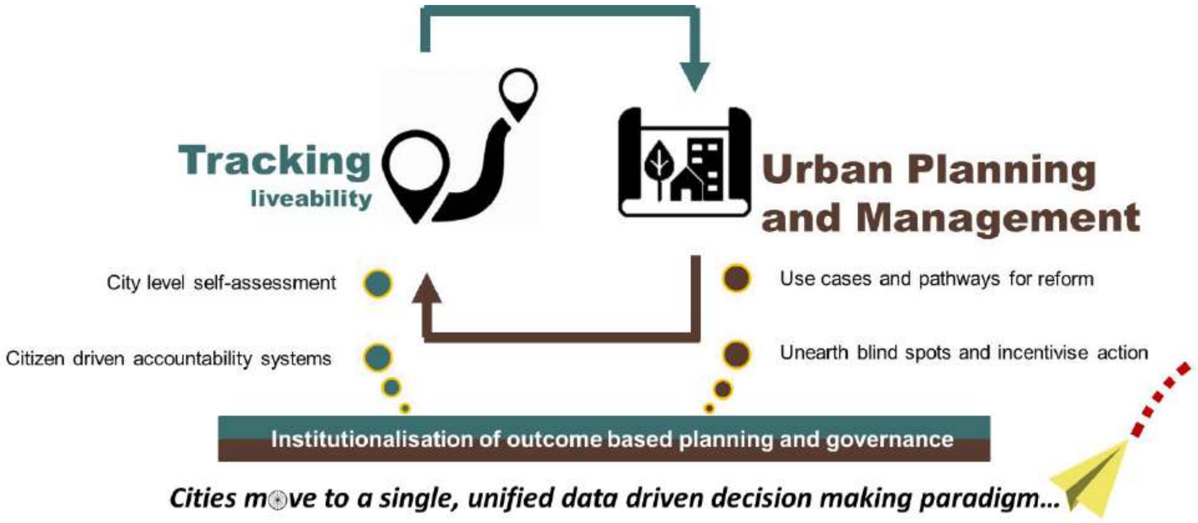
The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

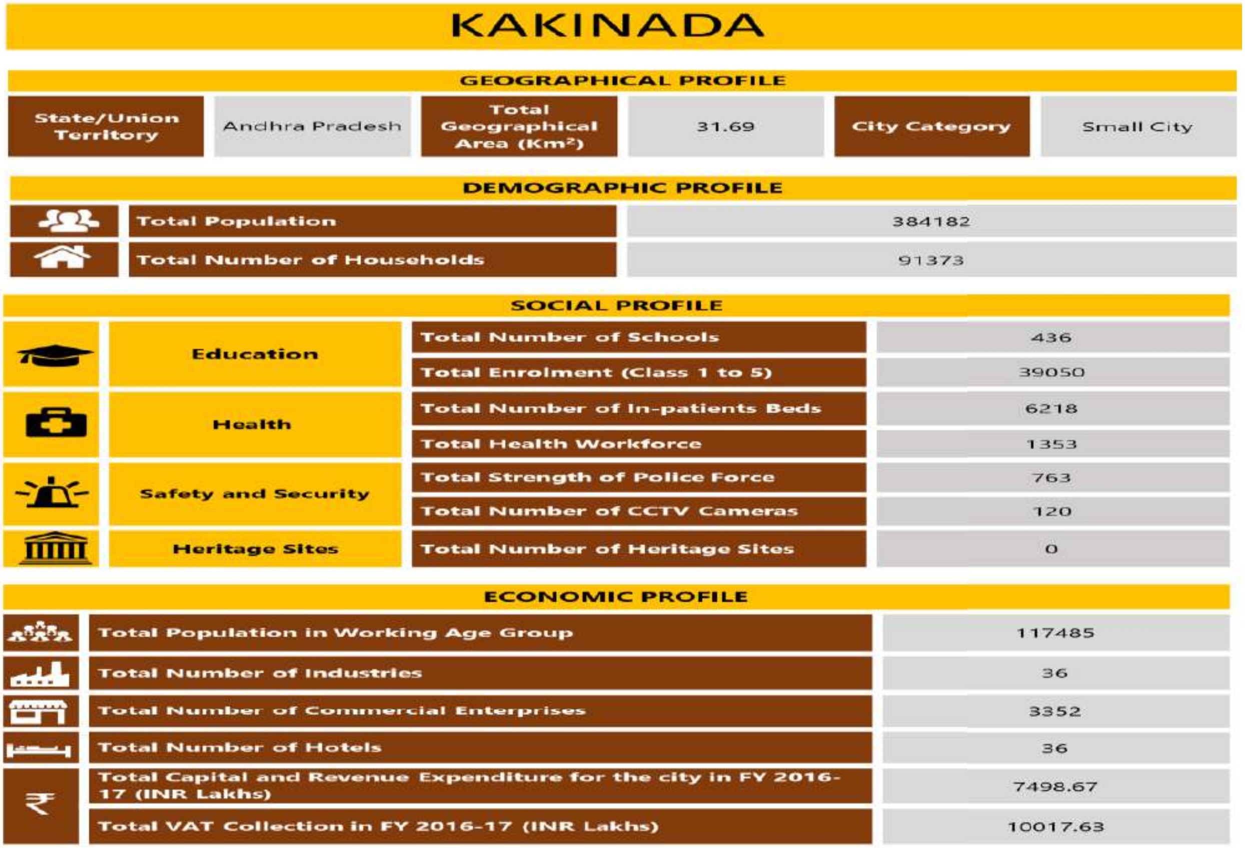
n population of above one million each. Implementation of in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



KAKINADA

GEOGRAPHICAL PROFILE

State/Union Territory	Andhra Pradesh	Total Geographical Area (Km²)	31.69	City Category	Small City

	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1518712
	Roads and Transport	Total Length of Road Network in the City (Km)	723
		Total length of arterial and sub-arterial road network in the city (Km)	8
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	9

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

ory Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	**Category**	**Indicators**
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Development		Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Development		Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

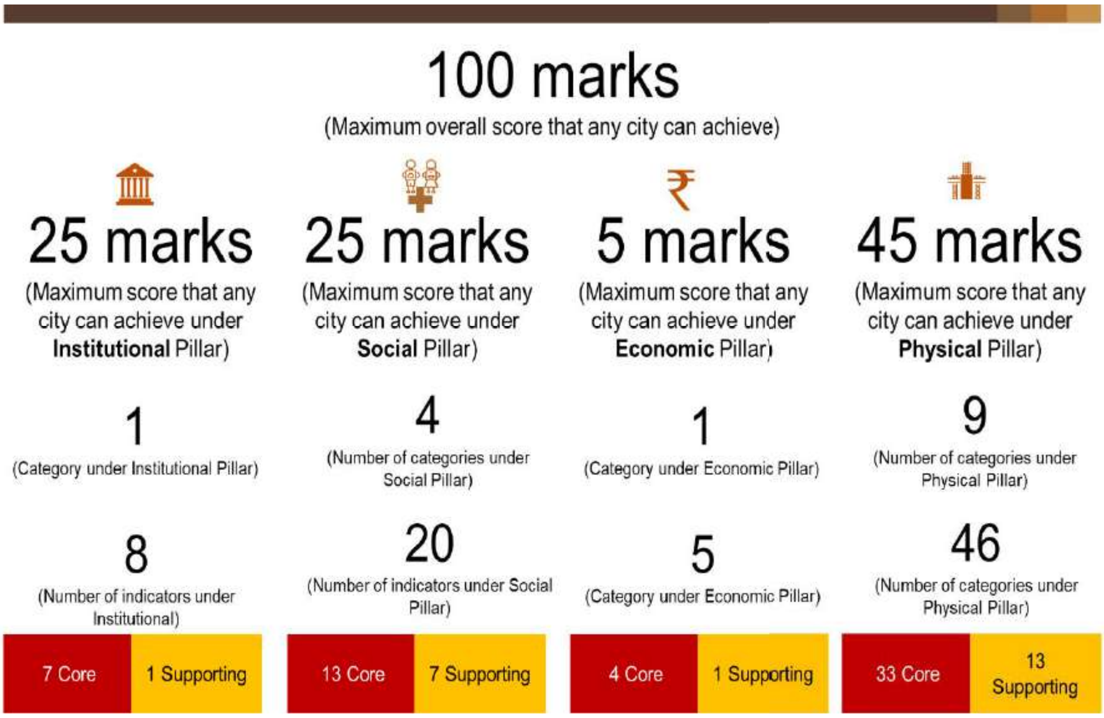
dology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)		25 marks (Maximum score that any city can achieve under **Social** Pillar)		5 marks (Maximum score that any city can achieve under **Economic** Pillar)		45 marks (Maximum score that any city can achieve under **Physical** Pillar)	
1 (Category under Institutional Pillar)		4 (Number of categories under Social Pillar)		1 (Category under Economic Pillar)		9 (Number of categories under Physical Pillar)	
8 (Number of indicators under Institutional)		20 (Number of indicators under Social Pillar)		5 (Category under Economic Pillar)		46 (Number of categories under Physical Pillar)	
7 Core	1 Supporting	13 Core	7 Supporting	4 Core	1 Supporting	33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Section
Urban Local Body	For Park and Recreation Related Questions	Town Planning Section/ Urban Planner (AMRUT)
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section, Revenue and Accounts Sections for financial figures
Urban Local Body	For Heritage sites related data	Not applicable as there was no such sites
Urban Local Body	For Ecological sites related data	Not applicable as there was no such sites
Urban Local Body	For Housing related data	Town Planning Section
Urban Local Body	For Building plan related data	Town Planning Section
Urban Local Body	For Roads related data	Engineering Section
Urban Local Body	For Solid waste management related data	Public Health and Engineering Sections
Urban Local Body	For IT services related data	IT Cell
Urban Local Body	For Vendor committee related data	Town Planning and Urban Poverty Alleviation Sections
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban	Administration and Revenue Sections, Urban Planner (AMRUT)

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 60 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**2**
DISCOM/Electricity Department	**9**
Traffic and Police Department	**2**
Development Authority	**0**
Pollution Control Board	**5**
State Renewable Energy Department	**1**
Town and Country Planning	**0**
State Health Department	**6**
Transport Authority	**4**
Disaster Management	**1**
Urban Local Body	**29**
Total	**60***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of

ata, survey results and other statistical records, log books

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

Table 5: Category wise scores 22

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

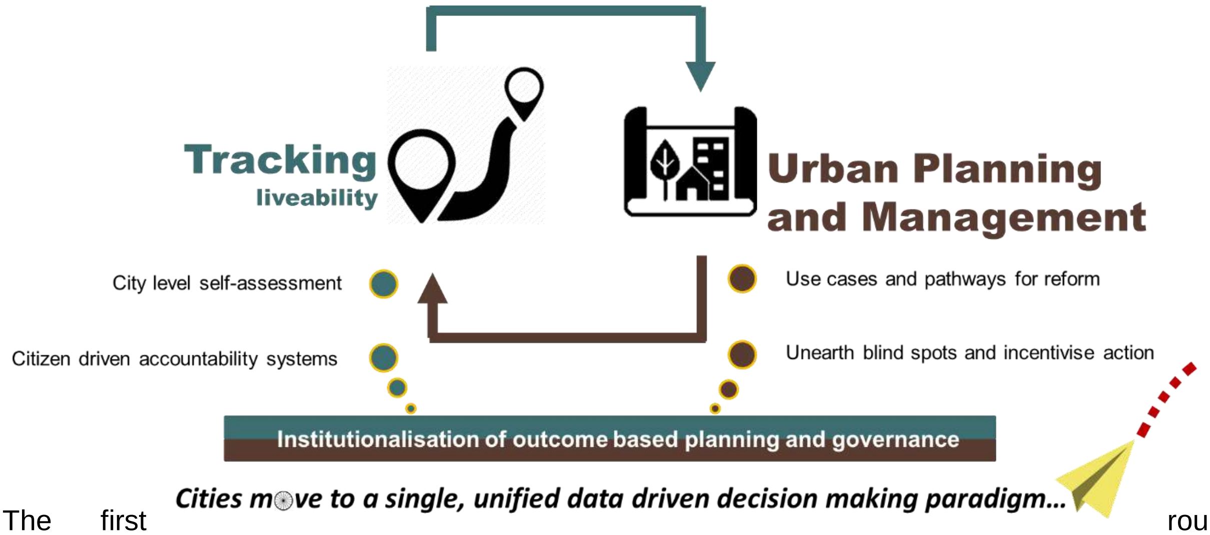
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

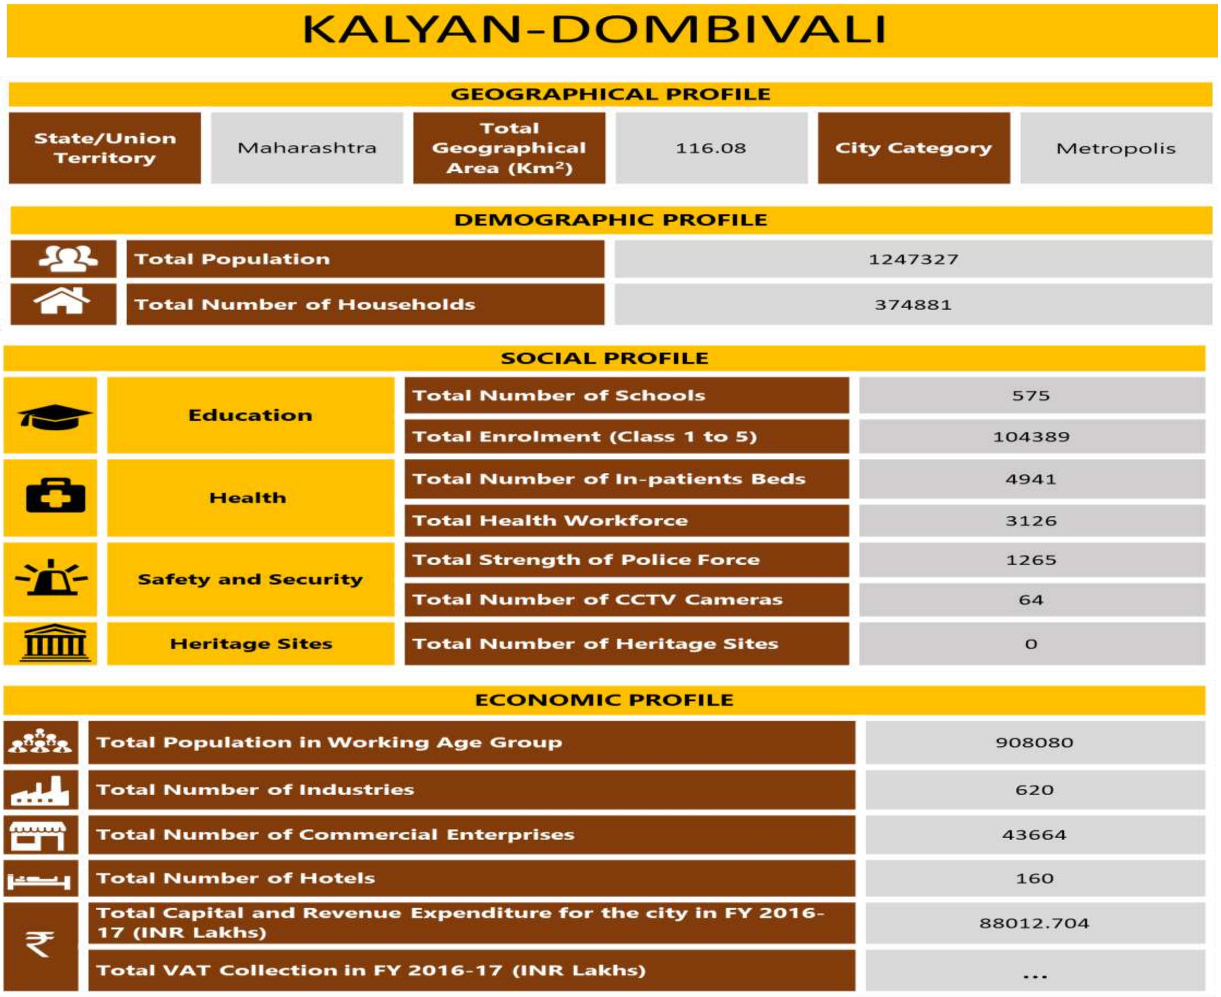


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



KALYAN-DOMBIVALI

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	Total Geographical Area (Km²)	116.08	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1247327
Total Number of Households	374881

SOCIAL PROFILE

Education	Total Number of Schools	575
	Total Enrolment (Class 1 to 5)	104389
Health	Total Number of In-patients Beds	4941
	Total Health Workforce	3126
Safety and Security	Total Strength of Police Force	1265
	Total Number of CCTV Cameras	64
Heritage Sites	Total Number of Heritage Sites	0

ECONOMIC PROFILE

Total Population in Working Age Group	908080
Total Number of Industries	620
Total Number of Commercial Enterprises	43664
Total Number of Hotels	160
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	88012.704
Total VAT Collection in FY 2016-17 (INR Lakhs)	...

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	310
		Total Number of Water Connections	105016
	Sanitation Facilities	Total number of households with access to individual toilets in the city	132500
		Total number of households in the city with access to community toilets in the city	383
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	650
		Total number of households covered through door-to-door collection of solid waste	310881
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	216
		Daily average quantum of waste water treated by STPs in the city (MLD)	44
	Electricity	Total number of authorized electrical connections in the city	595697
		Total electricity supplied to the city (kWh)	1768520000
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	0
	Roads and Transport	Total Length of Road Network in the City (Km)	488
		Total length of arterial and sub-arterial road network in the city (Km)	42
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	412

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary

Pillars of Comprehensive Development	Category	Indicators
		education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized

Pillars of Comprehensive Development	Category	Indicators
		electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way

Pillars of Comprehensive Development	Category	Indicators
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

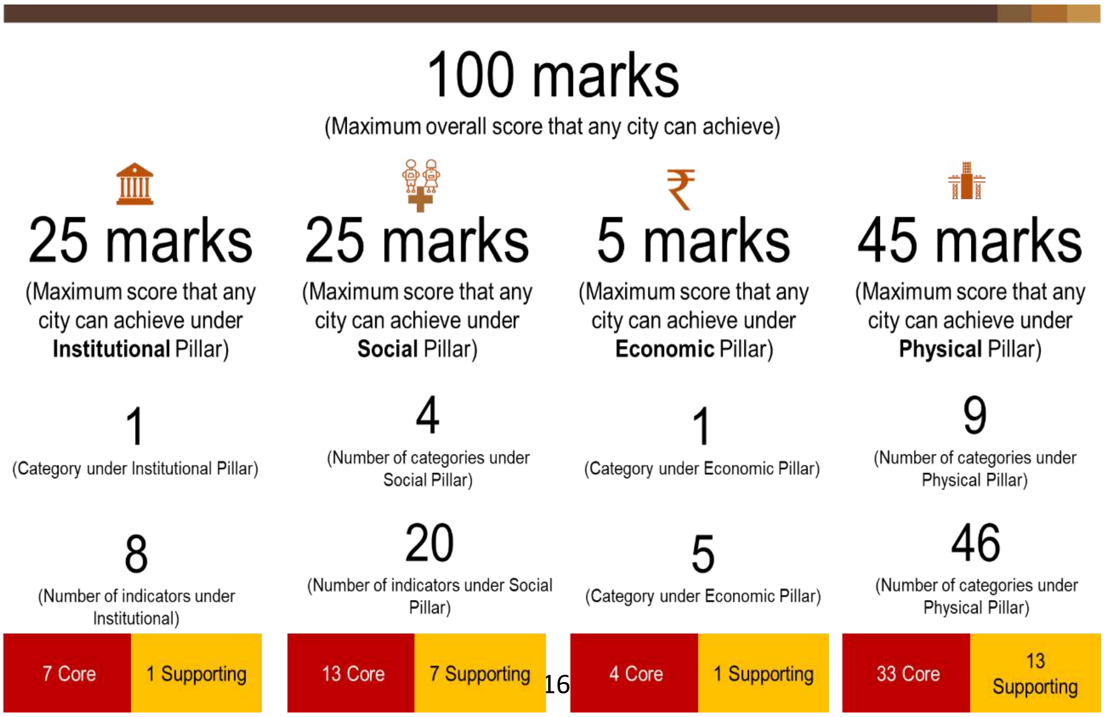
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks

(Maximum score that any city can achieve under **Institutional** Pillar)

1

(Category under Institutional Pillar)

8

(Number of indicators under Institutional)

7 Core | 1 Supporting

25 marks

(Maximum score that any city can achieve under **Social** Pillar)

4

(Number of categories under Social Pillar)

20

(Number of indicators under Social Pillar)

13 Core | 7 Supporting

5 marks

(Maximum score that any city can achieve under **Economic** Pillar)

1

(Category under Economic Pillar)

5

(Category under Economic Pillar)

4 Core | 1 Supporting

45 marks

(Maximum score that any city can achieve under **Physical** Pillar)

9

(Number of categories under Physical Pillar)

46

(Number of categories under Physical Pillar)

33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4 Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts
Urban Local Body	For Park and Recreation Related Questions	Solide Waste Management
Urban Local Body	For Water Supply and Drainage related questions	Water Supply and Drainage
Urban Local Body	For Heritage sites related data	
Urban Local Body	For Ecological sites related data	
Urban Local Body	For Housing related data	Town Planning
Urban Local Body	For Building plan related data	Town Planning
Urban Local Body	For Roads related data	Town Planning
Urban Local Body	For Solid waste management related data	Solid waste management
Urban Local Body	For IT services related data	Citizen Facilitation Centre
Urban Local Body	For Vendor committee related data	Solide Waste Management
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Account,Tax, IT,Health Dept
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Town Planning
	Construction planning	Town Planning
	Green Building	Town Planning
	Rain water harvesting	Town Planning
	Universal Design Principle	Town Planning
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	DISCOM
State Disaster		Disaster management

Designated data owners	Subcategories	Data owners at city level
management authority		
State Education Department		Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		DISCOM
State Sales / Commercial Taxes Department		Sales / Commercial Taxes Department
Town and Country Planning Department	Land Use	Town Planning
Traffic and Police Department		Traffic and Police Department
Transport Authorities	Buses	MSRTC
	Registered Vehicles	Traffic
	Sub urban rail transport	Railway Dept
	Mono Rail Authority	Railway Dept
	Tramways	Railway Dept
	Marine Transport Authority	Railway Dept

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 80 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**9**
DISCOM/Electricity Department	**4**
Traffic and Police Department	**5**
Development Authority	**7**
Pollution Control Board	**2**
State Renewable Energy Department	**1**
Town and Country Planning	**3**
State Health Department	**7**
Transport Authority	**7**
Disaster Management	**1**
Urban Local Body	**33**
Total	**80***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	40.47%
Identity & Culture	7%
Education	84%
Health	87%
Safety & Security	67%
Economy & Employment	38%
Housing & Inclusiveness	6%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	62%
Transport & Mobility	53%
Assured Water Supply	61%
Waste Water Management	42%
Solid Waste Management	68%
Reduced Pollution	64%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

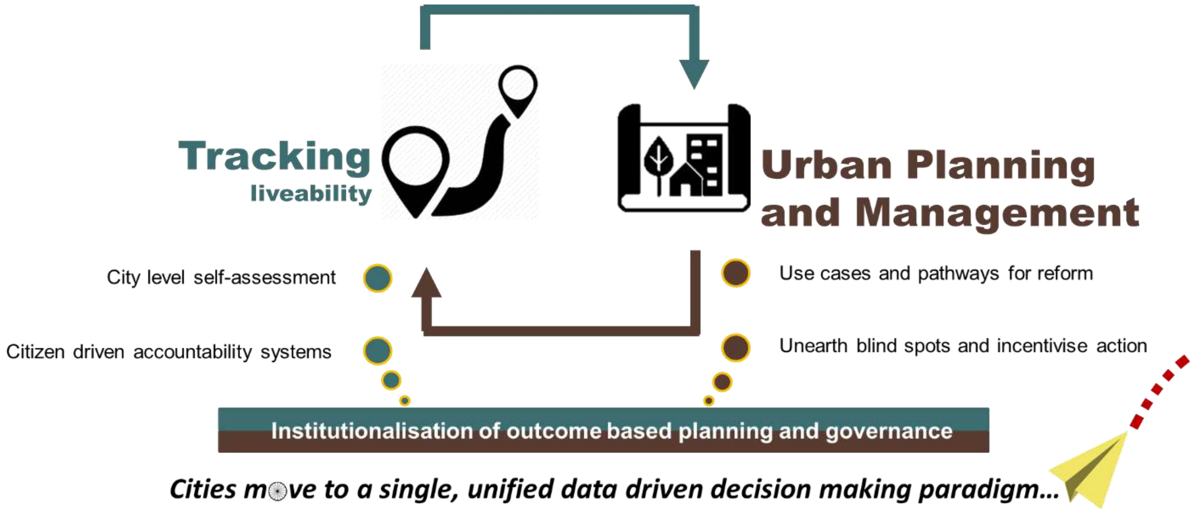
#	**Challenges**	**Proposed Solutions**
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities m◎ve to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

KANPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	260	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	2931269
Total Number of Households	528347

SOCIAL PROFILE

Education	**Total Number of Schools**	5314
	Total Enrolment (Class 1 to 5)	435112
Health	**Total Number of In-patient Beds**	16121
	Total Health Workforce	3194
Safety and Security	**Total Strength of Police Force**	2308
	Total Number of CCTV Cameras	50
Heritage Sites	**Total Number of Heritage Sites**	6

ECONOMIC PROFILE

Total Population in Working Age Group	804433
Total Number of Industries	3237
Total Number of Commercial Enterprises	65664
Total Number of Hotels	88
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	58390
Total VAT Collection in FY 2016-17 (INR Lakhs)	378474.38

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	430
	Total Number of Water Connection	196650
Sanitation Facilities	Total number of households with access to individual toilets in the city	472320
	Total number of households in the city with access to community toilets in the city	32302
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	1200
	Total number of households covered through door-to-door collection of solid waste	322260
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	301
	Daily average quantum of waste water treated by STPs in the city (MLD)	185
Electricity	Total number of authorized electrical connections in the city	583266
	Total electricity supplied to the city (kWh)	3657804000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	...
Roads and Transport	Total Length of Road Network in the City (Km)	4636.31
	Total length of arterial and sub-arterial road network in the city (Km)	146.31
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	32

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department Nagar Nigam Kanpur Nagar
Urban Local Body	For Park and Recreation Related Questions	Udyan vibhag Nagar nigam Kanpur Nagar
Urban Local Body	For Water Supply and Drainage related questions	Jal Nigam/Jalkal vibhag Nagar Nigam Kanpur Nagar Nagar
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB Kanpur Nagar
Urban Local Body	For Ecological sites related data	Forest Department Kanpur Nagar
Urban Local Body	For Housing related data	Kanpur Development Authority / Nirmaan Vibhag Nagar Nigam Kanpur/ DUDA Kanpur Nagar
Urban Local Body	For Building plan related data	Kanpur Development Authority Kanpur Nagar
Urban Local Body	For Roads related data	Public Works Department / Nirmaan Vibhag Nagar Nigam Kanpur
Urban Local Body	For Solid waste management related data	Health Department Nagar Nigam Kanpur
Urban Local Body	For IT services related data	GIS/ IT / Computer Department. Nagar Nigam Kanpur
Urban Local Body	For Vendor committee related data	District Urban Development Agency(DUDA) Kanpur Nagar
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District Urban Development Agency Kanpur Nagar
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh pollution Control Board Kanpur Nagar
Development Authority	Building Infrastructure	Kanpur Development Authority Kanpur
	Construction planning	Kanpur Development Authority Kanpur

Designated data owners	Subcategories	Data owners at city level
	Green Building	Kanpur Development Authority Kanpur
	Rain water harvesting	Kanpur Development Authority Kanpur
	Universal Design Principle	Kanpur Development Authority Kanpur
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	KESCO Kanpur Nagar / Uttar Pradesh Power Corporation Ltd Kanpur Nagar
State Disaster management authority		State Disaster Management Kanpur Nagar [ADM(FR]
State Education Department		Basic Siksha Adhikari / District Inspector of School Kanpur Nagar (DIOS)
State Health Department	Health care professionals	UP State Health Department Kanpur Nagar (CMO)
	Citizen Services	UP State Health Department Kanpur Nagar (CMO)
	Disease Prevalence	UP State Health Department Kanpur Nagar (CMO)
	Health Infrastructure	UP State Health Department Kanpur Nagar (CMO)
State Renewable Energy Development Agency	Renewable Energy	State Renewable Energy Develop. Agency(NEDA) Kanpur Nagar
State Sales / Commercial Taxes Department		Commercial Taxes Department Kanpur Nagar
Town and Country Planning Department	Land Use	Town and Country Planning Department Kanpur Nagar
Traffic and Police Department		Traffic police, Civil police Kanpur Nagar
Transport Authorities	Buses	Uttar Pradesh State Roadways Transport Corporation & Regional Transport Office Kanpur Nagar
	Registered Vehicles	Regional Transport Office Kanpur Nagar
	Sub urban rail transport	N A
	Mono Rail Authority	N A
	Tramways	N A
	Marine Transport Authority	N A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 39 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**1**
Development Authority	**1**
Pollution Control Board	**1**
State Renewable Energy Department	**1**
Town and Country Planning	**1**
State Health Department	**1**
Transport Authority	**1**
Disaster Management	**1**
Urban Local Body	**1**
Total	**39***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	47.51%
Identity & Culture	37%
Education	80%
Health	71%
Safety & Security	41%
Economy & Employment	10%
Housing & Inclusiveness	8%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	47%
Transport & Mobility	46%
Assured Water Supply	59%
Waste Water Management	73%
Solid Waste Management	85%
Reduced Pollution	56%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

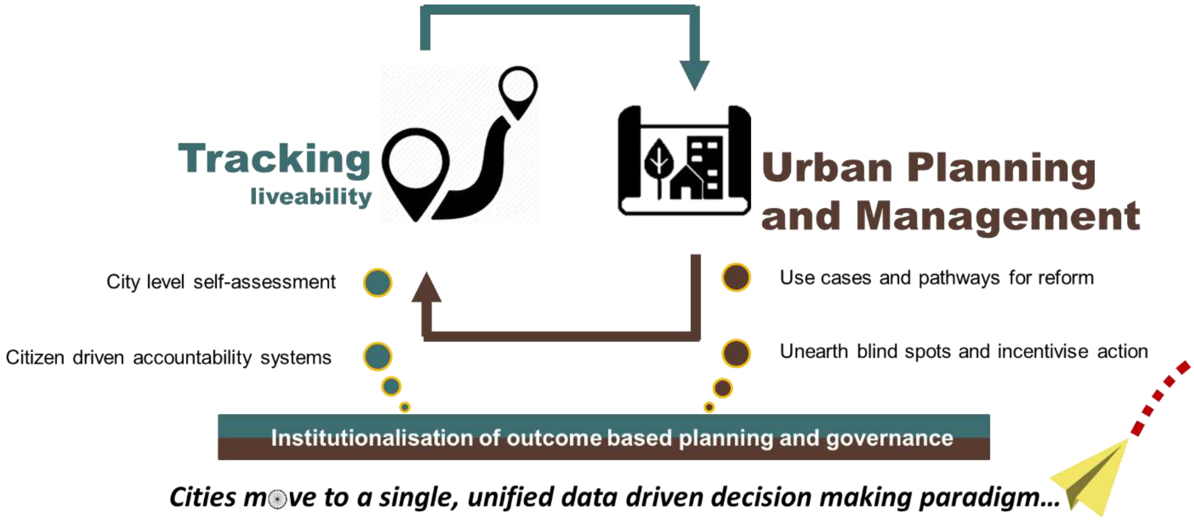
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

KARIM NAGAR

GEOGRAPHICAL PROFILE

State/Union Territory	Telengana	**Total Geographical Area (Km^2)**	23.5	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	301885
Total Number of Households	79080

SOCIAL PROFILE

Education	**Total Number of Schools**	202
	Total Enrolment (Class 1 to 5)	25084
Health	**Total Number of In-patient Beds**	686
	Total Health Workforce	529
Safety and Security	**Total Strength of Police Force**	236
	Total Number of CCTV Cameras	1414
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	105548
Total Number of Industries	54
Total Number of Commercial Enterprises	9205
Total Number of Hotels	6
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	4177
Total VAT Collection in FY 2016-17 (INR Lakhs)	10151.56

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	37
		Total Number of Water Connection	42237
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	28697
		Total number of households in the city with access to community toilets in the city	120
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	120
		Total number of households covered through door-to-door collection of solid waste	79880
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	38
		Daily average quantum of waste water treated by STPs in the city (MLD)	2
	Electricity	**Total number of authorized electrical connections in the city**	131685
		Total electricity supplied to the city (kWh)	224633933
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	182753
	Roads and Transport	**Total Length of Road Network in the City (Km)**	579
		Total length of arterial and sub-arterial road network in the city (Km)	8.39
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	4.95

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)		25 marks (Maximum score that any city can achieve under **Social** Pillar)		5 marks (Maximum score that any city can achieve under **Economic** Pillar)		45 marks (Maximum score that any city can achieve under **Physical** Pillar)	
1 (Category under Institutional Pillar)		4 (Number of categories under Social Pillar)		1 (Category under Economic Pillar)		9 (Number of categories under Physical Pillar)	
8 (Number of indicators under Institutional)		20 (Number of indicators under Social Pillar)		5 (Category under Economic Pillar)		46 (Number of categories under Physical Pillar)	
7 Core	1 Supporting	13 Core	7 Supporting	4 Core	1 Supporting	33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Section
Urban Local Body	For Park and Recreation Related Questions	Town Planning Section
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section
Urban Local Body	For Heritage sites related data	Tourism Department
Urban Local Body	For Ecological sites related data	Tourism Department
Urban Local Body	For Housing related data	Sanitation Section
Urban Local Body	For Building plan related data	Town Planning Section
Urban Local Body	For Roads related data	Town Planning Section
Urban Local Body	For Solid waste management related data	Sanitation Section
Urban Local Body	For IT services related data	Revenue, Engineering, Birth & Death, Town Planning, Sanitation Sections.
Urban Local Body	For Vendor committee related data	Town Planning Section
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Office of District Employment Exchange
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution control Board
Development Authority	Building Infrastructure	Town Planning Section
	Construction planning	Town Planning Section
	Green Building	
	Rain water harvesting	Town Planning Section
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Telangana Northern Power Distribution Company Limited
State Disaster management		District Collectorate

Designated data owners	Subcategories	Data owners at city level
authority		
State Education Department		District Medical and Health Office
State Health Department	Health care professionals	District Medical and Health Office
	Citizen Services	District Medical and Health Office
	Disease Prevalence	District Medical and Health Office
	Health Infrastructure	District Medical and Health Office
State Renewable Energy Development Agency	Renewable Energy	Telangana Northern Power Distribution Company Limited
State Sales / Commercial Taxes Department		Commercial Tax Office
Town and Country Planning Department	Land Use	Town Planning Section
Traffic and Police Department		Police Commissionerate
Transport Authorities	Buses	Telangana State Road Transport Corporation
	Registered Vehicles	Road Transport Authority
	Sub urban rail transport	Not applicable as the facility is not there in the city
	Mono Rail Authority	Not applicable as the facility is not there in the city
	Tramways	Not applicable as the facility is not there in the city
	Marine Transport Authority	Not applicable as the facility is not there in the city

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 196 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**8**
Traffic and Police Department	**3**
Development Authority	**13**
Pollution Control Board	**2**
State Renewable Energy Department	**1**
Town and Country Planning	**4**
State Health Department	**3**
Transport Authority	**3**
Disaster Management	**0**
Urban Local Body	**157**
Total	**196***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	63.79%
Identity & Culture	42%
Education	79%
Health	96%
Safety & Security	62%
Economy & Employment	22%
Housing & Inclusiveness	9%
Public Open Spaces	4%
Mixed Land Use & Compactness	0%
Power Supply	51%
Transport & Mobility	17%
Assured Water Supply	81%
Waste Water Management	34%
Solid Waste Management	72%
Reduced Pollution	89%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

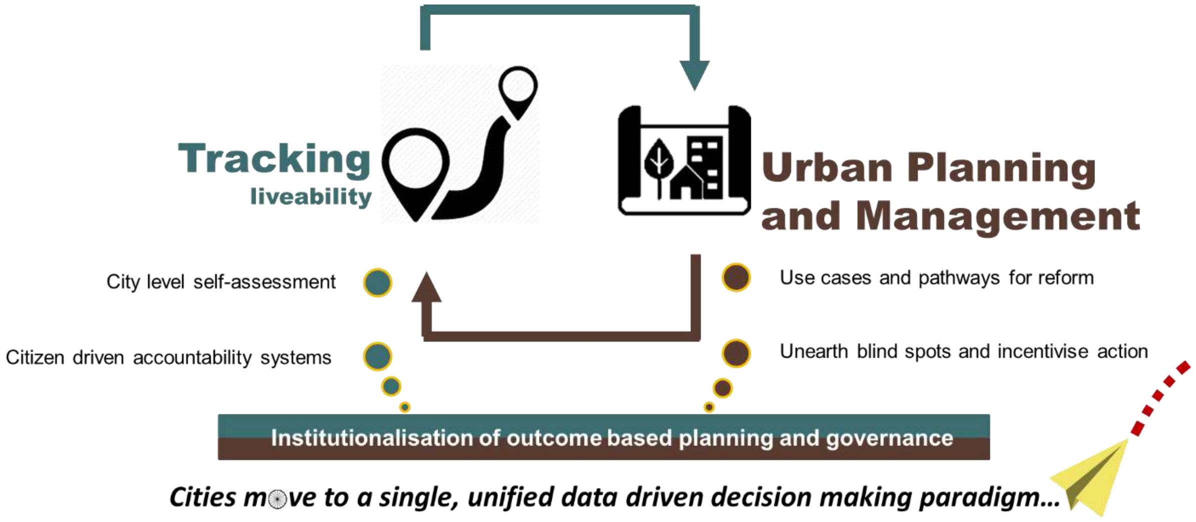
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

KARNAL

GEOGRAPHICAL PROFILE

State/Union Territory	Haryana	**Total Geographical Area (Km²)**	87	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	397000
Total Number of Households	77668

SOCIAL PROFILE

Education	**Total Number of Schools**	194
	Total Enrolment (Class 1 to 5)	36362
Health	**Total Number of In-patient Beds**	3402
	Total Health Workforce	1791
Safety and Security	**Total Strength of Police Force**	283
	Total Number of CCTV Cameras	129
Heritage Sites	**Total Number of Heritage Sites**	25

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	955
Total Number of Commercial Enterprises	21061
Total Number of Hotels	34
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	6932.51
Total VAT Collection in FY 2016-17 (INR Lakhs)	100659.39

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	85.97
	Total Number of Water Connection	37524
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	77028
	Total number of households in the city with access to community toilets in the city	640
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	140
	Total number of households covered through door-to-door collection of solid waste	77668
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	63.5
	Daily average quantum of waste water treated by STPs in the city (MLD)	55
Electricity	**Total number of authorized electrical connections in the city**	99726
	Total electricity supplied to the city (kWh)	4389.25
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	5000
Roads and Transport	**Total Length of Road Network in the City (Km)**	691.38
	Total length of arterial and sub-arterial road network in the city (Km)	19.4
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	34.3

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

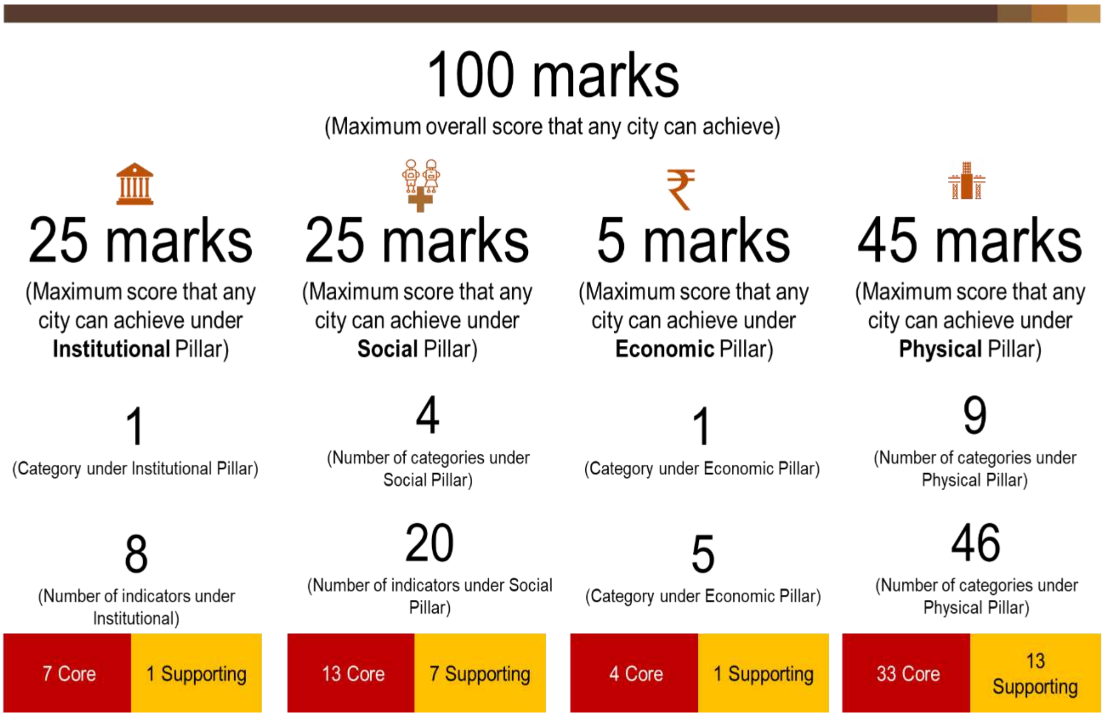
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal Corporation Karnal
Urban Local Body	For Park and Recreation Related Questions	Municipal Corporation Karnal
Urban Local Body	For Water Supply and Drainage related questions	Municipal Corporation Karnal
Urban Local Body	For Heritage sites related data	Municipal Corporation Karnal
Urban Local Body	For Ecological sites related data	Municipal Corporation Karnal
Urban Local Body	For Housing related data	Municipal Corporation Karnal
Urban Local Body	For Building plan related data	Municipal Corporation Karnal
Urban Local Body	For Roads related data	Municipal Corporation Karnal
Urban Local Body	For Solid waste management related data	Municipal Corporation Karnal
Urban Local Body	For IT services related data	Municipal Corporation Karnal
Urban Local Body	For Vendor committee related data	Municipal Corporation Karnal
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban	Municipal Corporation Karnal

Designated data owners	Subcategories	Data owners at city level
	Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Haryana State Pollution Control Board
Development Authority	Building Infrastructure	Haryana Urban Development Authority
	Construction planning	Haryana Urban Development Authority
	Green Building	Haryana Urban Development Authority
	Rain water harvesting	Haryana Urban Development Authority

Transport Authorities	Buses	Haryana Roadways
	Registered Vehicles	Transport Authority
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	

Designated data owners	Subcategories	Data owners at city level
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 6 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	3
Transport Authority	0
Disaster Management	1
Urban Local Body	0
Total	6*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of

data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	46.84%
Identity & Culture	31%
Education	94%
Health	100%
Safety & Security	57%
Economy & Employment	32%
Housing & Inclusiveness	6%
Public Open Spaces	2%
Mixed Land Use & Compactness	0%
Power Supply	71%
Transport & Mobility	21%
Assured Water Supply	56%
Waste Water Management	84%
Solid Waste Management	89%
Reduced Pollution	80%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

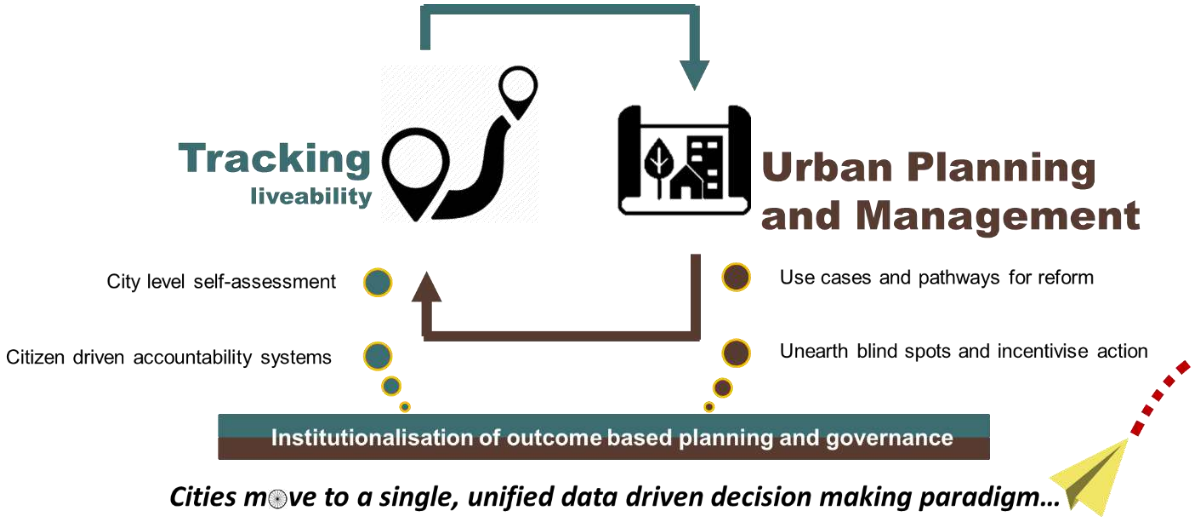
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



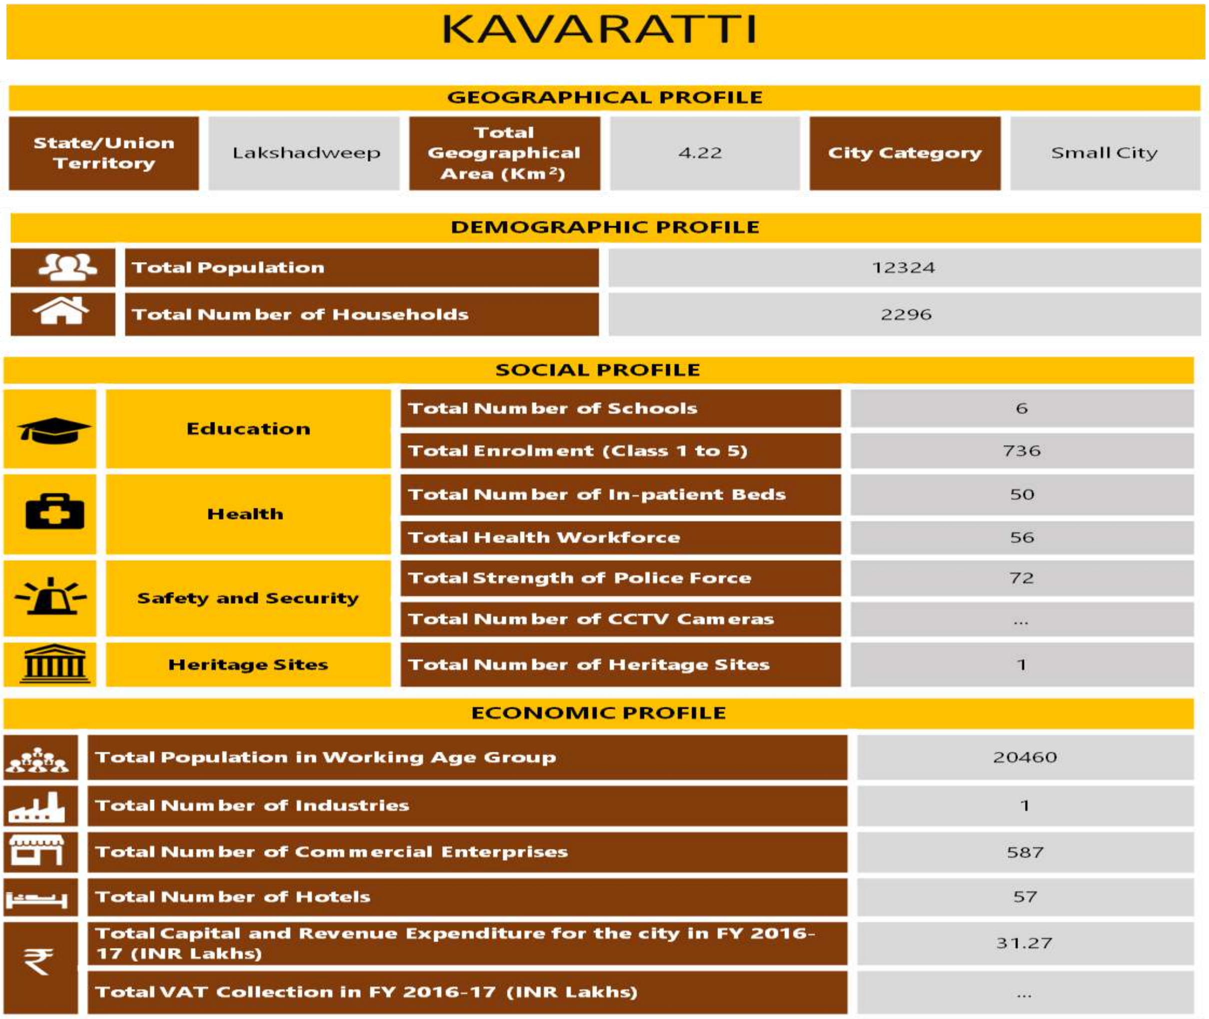
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



KAVARATTI

GEOGRAPHICAL PROFILE

State/Union Territory	Lakshadweep	**Total Geographical Area (Km^2)**	4.22	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	12324
Total Number of Households	2296

SOCIAL PROFILE

Education	**Total Number of Schools**	6
	Total Enrolment (Class 1 to 5)	736
Health	**Total Number of In-patient Beds**	50
	Total Health Workforce	56
Safety and Security	**Total Strength of Police Force**	72
	Total Number of CCTV Cameras	...
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	20460
Total Number of Industries	1
Total Number of Commercial Enterprises	587
Total Number of Hotels	57
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	31.27
Total VAT Collection in FY 2016-17 (INR Lakhs)	...

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	0.945
	Total Number of Water Connection	630
Sanitation Facilities	Total number of households with access to individual toilets in the city	2296
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	0.491
	Total number of households covered through door-to-door collection of solid waste	2246
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	1.1
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	4562
	Total electricity supplied to the city (kWh)	12029822
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	4130000
Roads and Transport	Total Length of Road Network in the City (Km)	36
	Total length of arterial and sub-arterial road network in the city (Km)	...
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary

Pillars of Comprehensive Development	Category	Indicators
		education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational

Pillars of Comprehensive Development	Category	Indicators
		places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System

Pillars of Comprehensive Development	Category	Indicators
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse

Pillars of Comprehensive Development	Category	Indicators
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

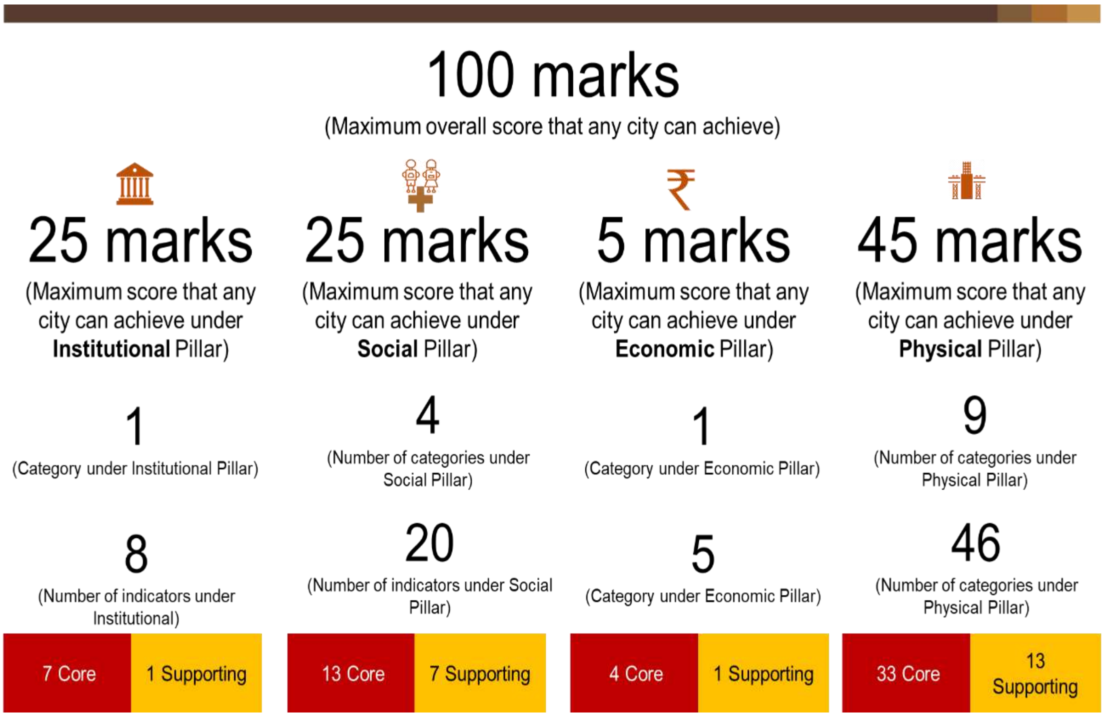
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core | 1 Supporting	13 Core | 7 Supporting	4 Core | 1 Supporting	33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were

identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	District administration
Urban Local Body	For Park and Recreation Related Questions	PWD - Public works department
Urban Local Body	For Water Supply and Drainage related questions	PWD
Urban Local Body	For Heritage sites related data	Science and Technology
Urban Local Body	For Ecological sites related data	Science and Technology
Urban Local Body	For Housing related data	PWD
Urban Local Body	For Building plan related data	PWD
Urban Local Body	For Roads related data	Transport department
Urban Local Body	For Solid waste management related data	PWD and Forest department
Urban Local Body	For IT services related data	PWD
Urban Local Body	For Vendor committee related data	Kavaratti Panchayat
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	PWD, Pollution control department
Development Authority	Building Infrastructure	PWD
	Construction planning	PWD
	Green Building	PWD
	Rain water harvesting	PWD
	Universal Design Principle	PWD
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity department
State Disaster management authority		PWD
State Education Department		Directorate of education

Designated data owners	Subcategories	Data owners at city level
State Health Department	Health care professionals	Directorate of Health services
	Citizen Services	Directorate of Health services
	Disease Prevalence	Directorate of Health services
	Health Infrastructure	Directorate of Health services
State Renewable Energy Development Agency		Electricity department
State Sales / Commercial Taxes Department		NA
Town and Country Planning Department	Land Use	PWD
Traffic and Police Department		Police department
Transport Authorities	Buses	NA
	Registered Vehicles	Transport department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	Marine transport department

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 37 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**2**
DISCOM/Electricity Department	**3**
Traffic and Police Department	**3**
Development Authority	**0**
Pollution Control Board	**2**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**3**
Transport Authority	**4**
Disaster Management	**2**
Urban Local Body	**17**
Total	**37***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	48.62%
Identity & Culture	29%
Education	70%
Health	92%
Safety & Security	66%
Economy & Employment	0%
Housing & Inclusiveness	0%
Public Open Spaces	52%
Mixed Land Use & Compactness	0%
Power Supply	45%
Transport & Mobility	-2%

Assured Water Supply	36%
Waste Water Management	40%
Solid Waste Management	49%
Reduced Pollution	20%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

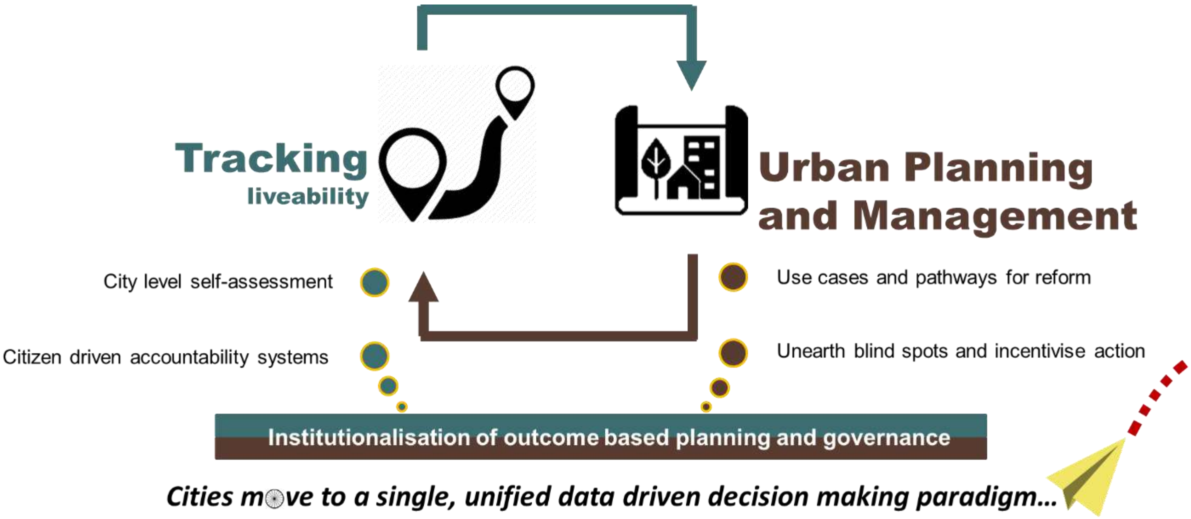
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

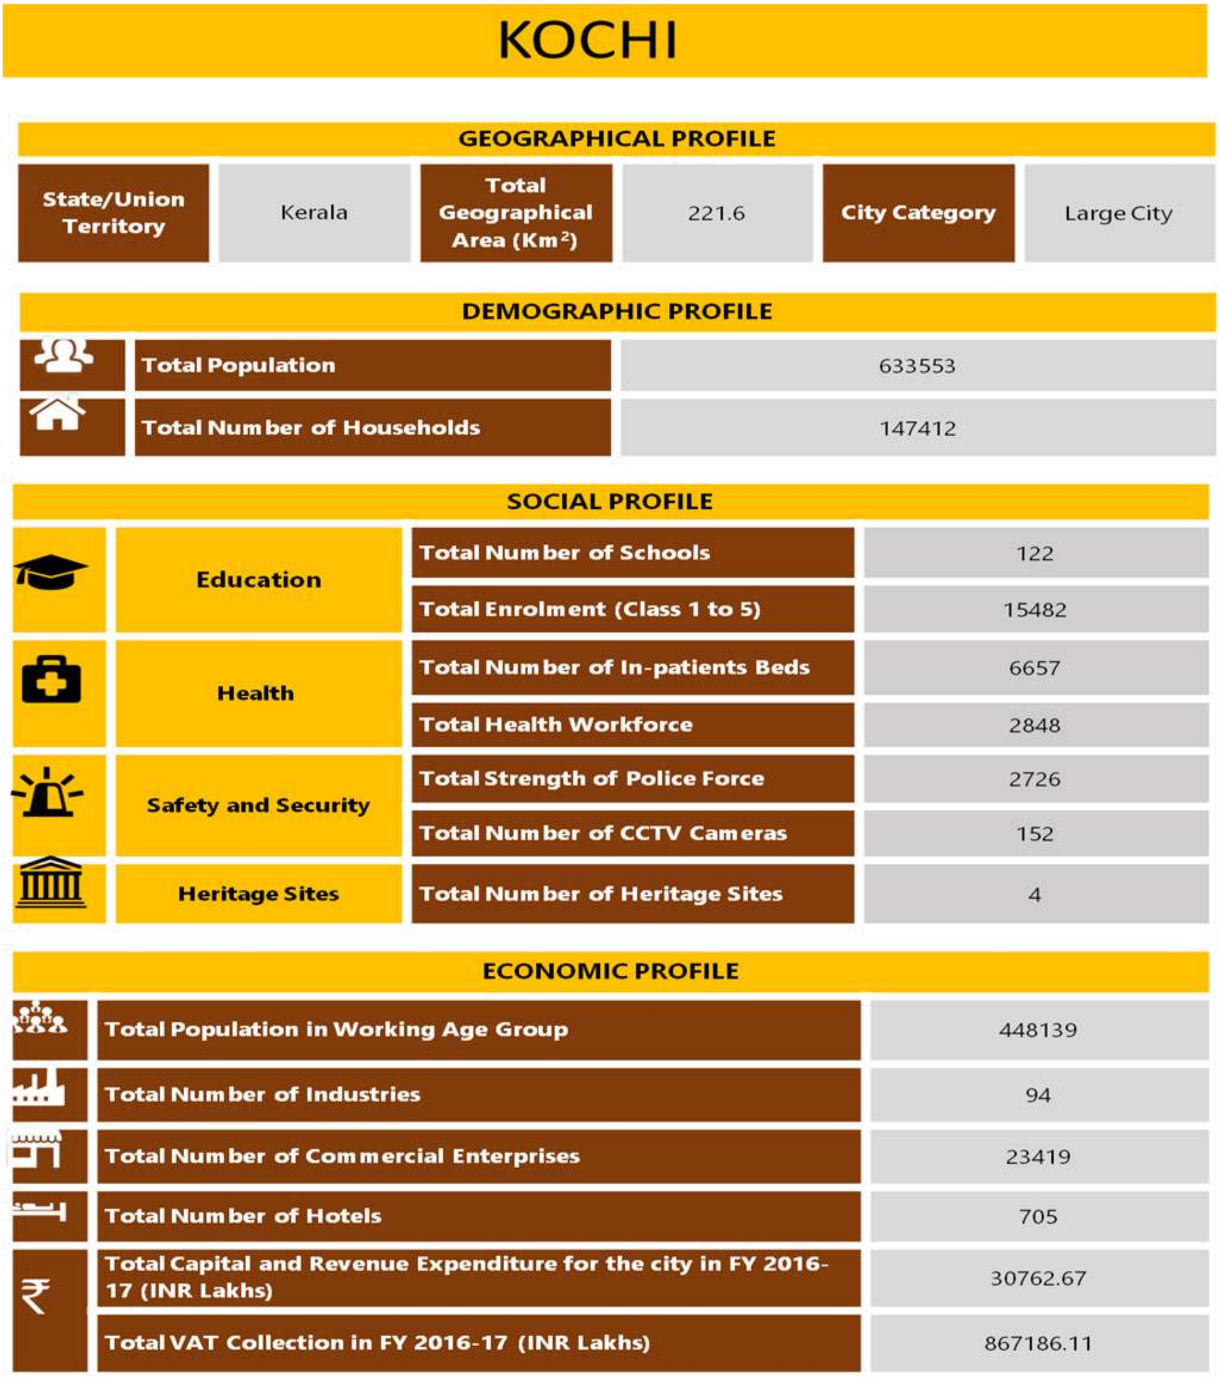


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



KOCHI

GEOGRAPHICAL PROFILE

State/Union Territory	Kerala	**Total Geographical Area (Km²)**	221.6	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	633553
Total Number of Households	147412

SOCIAL PROFILE

Education	**Total Number of Schools**	122
	Total Enrolment (Class 1 to 5)	15482
Health	**Total Number of In-patients Beds**	6657
	Total Health Workforce	2848
Safety and Security	**Total Strength of Police Force**	2726
	Total Number of CCTV Cameras	152
Heritage Sites	**Total Number of Heritage Sites**	4

ECONOMIC PROFILE

Total Population in Working Age Group	448139
Total Number of Industries	94
Total Number of Commercial Enterprises	23419
Total Number of Hotels	705
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	30762.67
Total VAT Collection in FY 2016-17 (INR Lakhs)	867186.11

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	185
	Total Number of Water Connections	149030
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	..
	Total number of households in the city with access to community toilets in the city	1207
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	278
	Total number of households covered through door-to-door collection of solid waste	140000
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	73
	Daily average quantum of waste water treated by STPs in the city (MLD)	30
Electricity	**Total number of authorized electrical connections in the city**	283657
	Total electricity supplied to the city (kWh)	694900000
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	25447.84
Roads and Transport	**Total Length of Road Network in the City (Km)**	1135.733
	Total length of arterial and sub-arterial road network in the city (Km)	197.1882
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	29.455

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

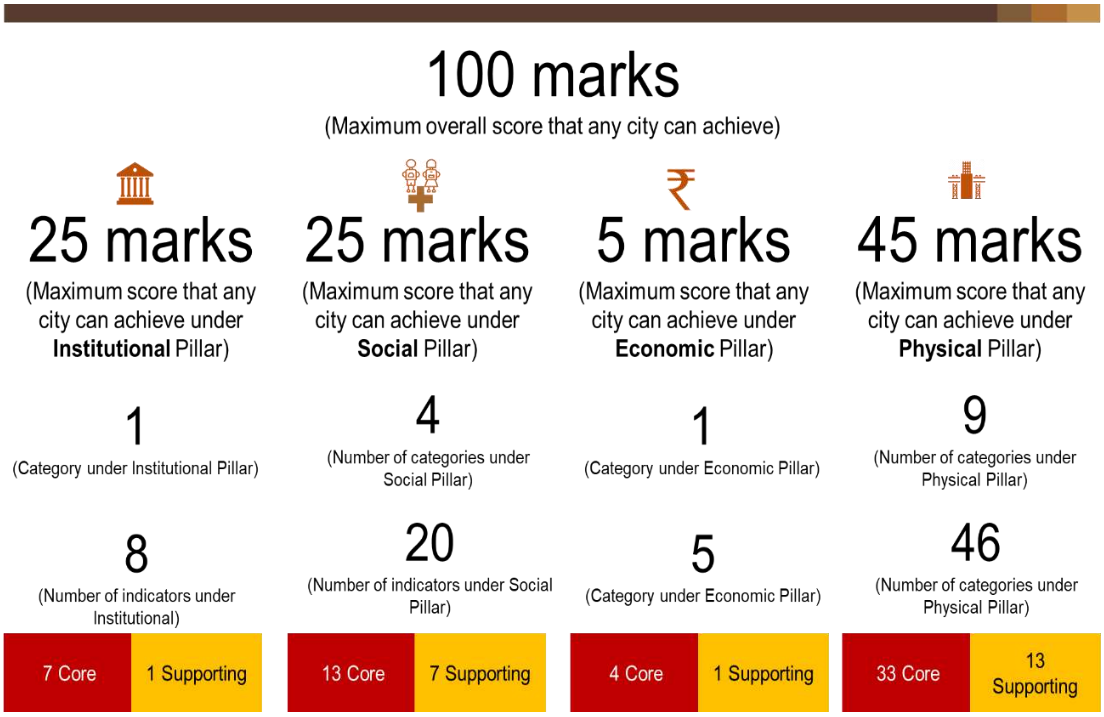
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Revenue Officer, Accounts Officer
Urban Local Body	For Park and Recreation Related Questions	Executive Engineer, Engineering Department
Urban Local Body	For Water Supply and Drainage related questions	Executive Engineer, P.H.Division, Kerala Water Authority, Thevara, Ernakulam (Separate Department not ULB)
Urban Local Body	For Heritage sites related data	Executive Engineer, Engineering Department
Urban Local Body	For Ecological sites related data	Executive Engineer, Engineering Department
Urban Local Body	For Housing related data	Manager, PMAY
Urban Local Body	For Building plan related data	Executive Engineer, Engineering Department
Urban Local Body	For Roads related data	Executive Engineer, Engineering Department
Urban Local Body	For Solid waste management related data	Health Officer
Urban Local Body	For IT services related data	Project Manager-TCS ***Not Direct staff of Kochi Corporation. All IT and Online services are done by TCS which is housed at Kochi Municipal Corporation.***
Urban Local Body	For Vendor committee related data	Manager, NULM
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	**Ward Sabha Details**-Superintendent, Planning cell **Offline Grievances**- Superintendent, General Section **Population Details**-Senior Clerk,

Designated data owners	Subcategories	Data owners at city level
		Census Department **Unemployment Data Source :(Not ULB)** 1.District Employment Officer, District Employment Office, Ernakulam 2. Divisional Employment Officer, Professional & Executive Exchange, Ernakulam **Online Service** Project Manager-TCS **Sewerage Services :** Environment Engineer under Engineering Department **Transport & City Mobility Plan Details** Kochi Smart City Mission
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Kerala State Pollution Control Board, Regional Office, Ernakulam
Development Authority	Building Infrastructure	Executive Engineer, Engineering Department of ULB. In Kerala scenario this aspect comes under ULB
	Construction planning	Executive Engineer, Engineering Department of ULB. In Kerala scenario this aspect comes under ULB
	Green Building	Executive Engineer, Engineering Department of ULB. In Kerala scenario this aspect comes under ULB
	Rain water harvesting	Executive Engineer, Engineering Department of ULB. In Kerala scenario this aspect comes under ULB
	Universal Design Principle	Executive Engineer, Engineering Department of ULB. In Kerala scenario this aspect comes under ULB
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Deputy Chief Engineer, Kerala State Electricity Board Ltd, Electrical Circle, Ernakulam
State Disaster management authority		District Disaster Management Authority, Civil Station, Kakkanad
State Education Department		District Education Officer, Ernakulam

Designated data owners	Subcategories	Data owners at city level
State Health Department	Health care professionals	District Medical Office (Health), Ernakulam
	Citizen Services	District Medical Office (Health), Ernakulam
	Disease Prevalence	District Medical Office (Health), Ernakulam
	Health Infrastructure	District Medical Office (Health), Ernakulam
State Renewable Energy Development Agency		ANERT, Kakkanad
State Sales / Commercial Taxes Department		1.Deputy Commissioner, Deputy Commissioner Office, Sales and Commercial Tax Department, Thevara, Ernakulam 2. Deputy Commissioner, Deputy Commissioner Office, Sales and Commercial Tax Department, Mattancherry, Ernakulam
Town and Country Planning Department	Land Use	Senior Town Planner, Town and Country Planning Department, Civil Station, Kakkanad
Traffic and Police Department		City Police Commissioner, Kochi City
Transport Authorities	Buses	Regional Transport Office, Civil Station, Kakkanad
	Registered Vehicles	Regional Transport Office, Civil Station, Kakkanad
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	Senior Superintendent, Regional Office, Water Transport, Ernakulam

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 36 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**1**
DISCOM/Electricity Department	**0**
Traffic and Police Department	**4**
Development Authority	**0**
Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**2**
Transport Authority	**1**
Disaster Management	**0**
Urban Local Body	**26**
Total	**36***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	69.02%
Identity & Culture	9%
Education	68%
Health	86%
Safety & Security	68%
Economy & Employment	34%
Housing & Inclusiveness	8%
Public Open Spaces	2%
Mixed Land Use & Compactness	8%
Power Supply	52%
Transport & Mobility	30%
Assured Water Supply	55%
Waste Water Management	12%
Solid Waste Management	64%
Reduced Pollution	81%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

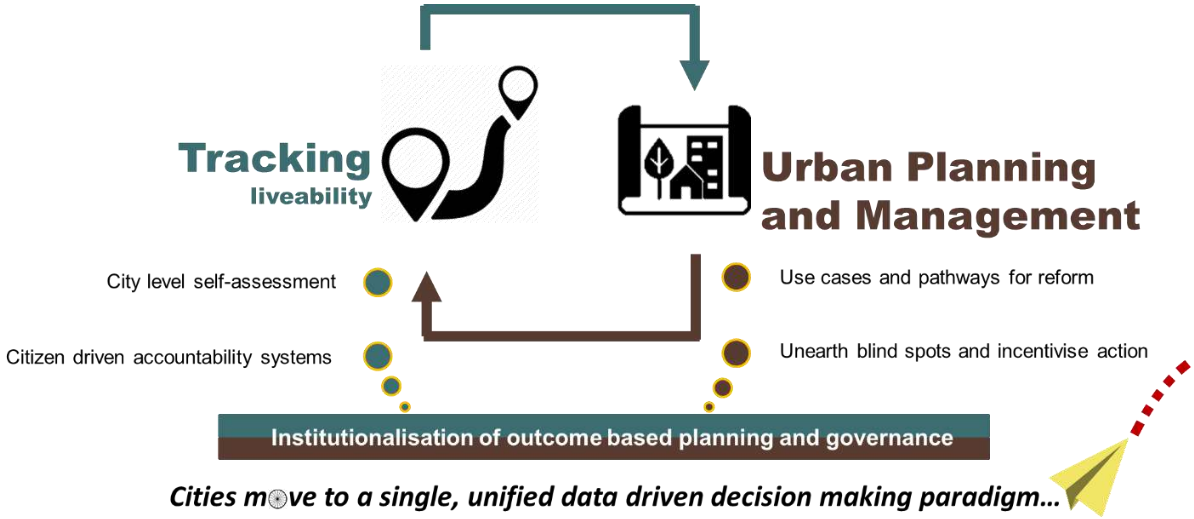
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

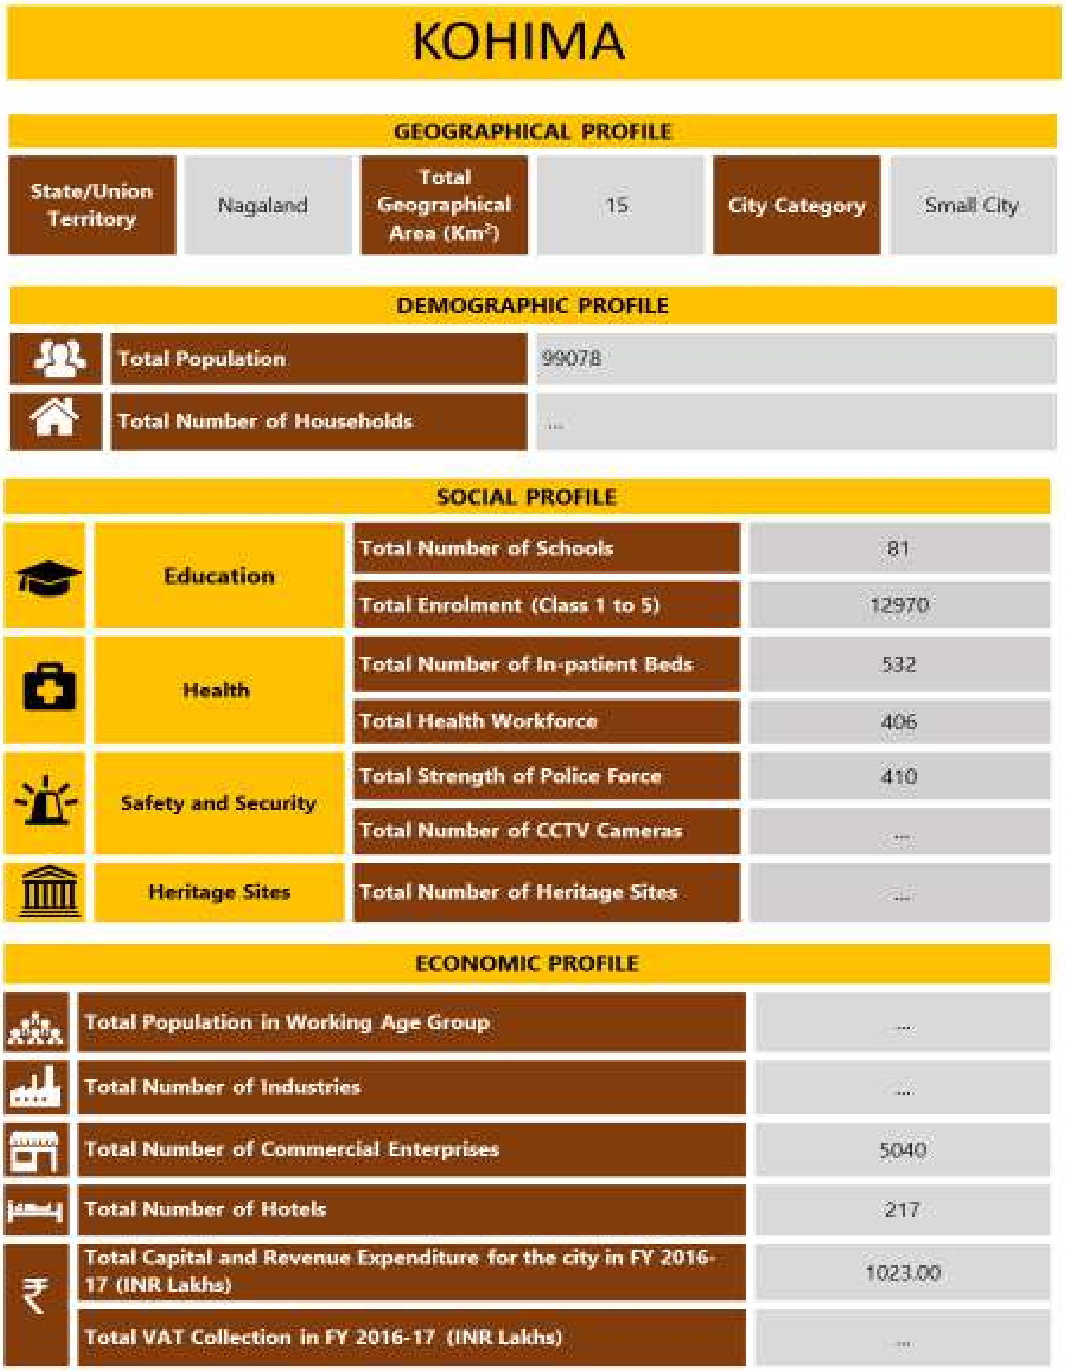
Cities m◉ve to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



KOHIMA

GEOGRAPHICAL PROFILE

State/Union Territory	Nagaland	**Total Geographical Area (Km^2)**	15	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	99078
Total Number of Households	...

SOCIAL PROFILE

Education	**Total Number of Schools**	81
	Total Enrolment (Class 1 to 5)	12970
Health	**Total Number of In-patient Beds**	532
	Total Health Workforce	406
Safety and Security	**Total Strength of Police Force**	410
	Total Number of CCTV Cameras	...
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	...
	Total Number of Water Connections	...
Sanitation Facilities	Total number of households with access to individual toilets in the city	...
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	25000
	Total number of households covered through door-to-door collection of solid waste	70
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	20000
	Total electricity supplied to the city (kWh)	40
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	...
Roads and Transport	Total Length of Road Network in the City (Km)	108.7
	Total length of arterial and sub-arterial road network in the city (Km)	...
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration

Pillars of Comprehensive Development	Category	Indicators
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and**	6.1 Increase in VAT/GST collection

Pillars of Comprehensive Development	Category	Indicators
	Employment	6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms

Pillars of Comprehensive Development	Category	Indicators
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility

Pillars of Comprehensive Development	Category	Indicators
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal Council
Urban Local Body	For Park and Recreation Related Questions	
Urban Local Body	For Water Supply and Drainage related questions	Public Health Engineering
Urban Local Body	For Heritage sites related data	Tourism
Urban Local Body	For Ecological sites related data	Tourism
Urban Local Body	For Housing related data	Department of Housing
Urban Local Body	For Building plan related data	
Urban Local Body	For Roads related data	Public Works Department
Urban Local Body	For Solid waste management related data	Municipal Council
Urban Local Body	For IT services related data	Department of Information and Technology
Urban Local Body	For Vendor committee related data	Municipal Council
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	

Designated data owners	Subcategories	Data owners at city level
Development Authority	Building Infrastructure	
	Construction planning	
	Green Building	
	Rain water harvesting	
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Department of Power
State Disaster management authority	Disaster management	Disaster management
State Education Department		
State Health Department	Health care professionals	Department of Health and Family Welfare
State Health Department	Citizen Services	Department of Health and Family Welfare
State Health Department	Disease Prevalence	Department of Health and Family Welfare
State Health Department	Health Infrastructure	Department of Health and Family Welfare
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		Department of Taxes
Town and Country Planning Department	Land Use	
Traffic and Police Department		
Transport Authorities	Buses	Nagaland State Transport
Transport Authorities	Registered Vehicles	Nagaland State Transport
Transport Authorities	Sub urban rail transport	NA
Transport Authorities	Mono Rail Authority	NA
Transport Authorities	Tramways	NA
Transport Authorities	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 9 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register,

signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	1
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	1
Transport Authority	1
Disaster Management	0
Urban Local Body	2
Total	9

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	34.21%
Identity & Culture	12%
Education	93%
Health	87%
Safety & Security	58%
Economy & Employment	0%
Housing & Inclusiveness	0%
Public Open Spaces	6%
Mixed Land Use & Compactness	25%
Power Supply	47%
Transport & Mobility	19%
Assured Water Supply	2%
Waste Water Management	0%
Solid Waste Management	33%
Reduced Pollution	83%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

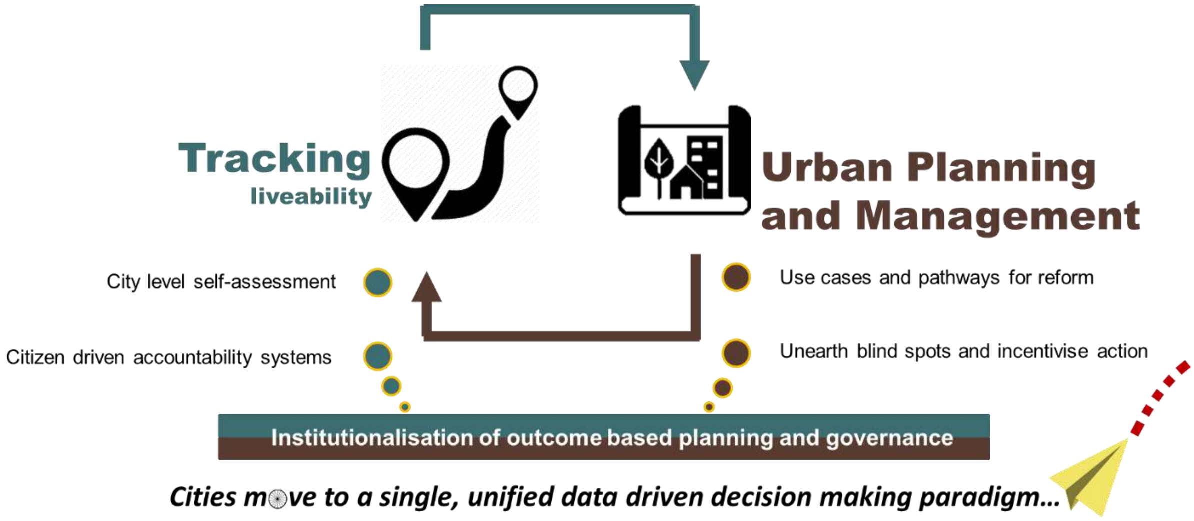
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

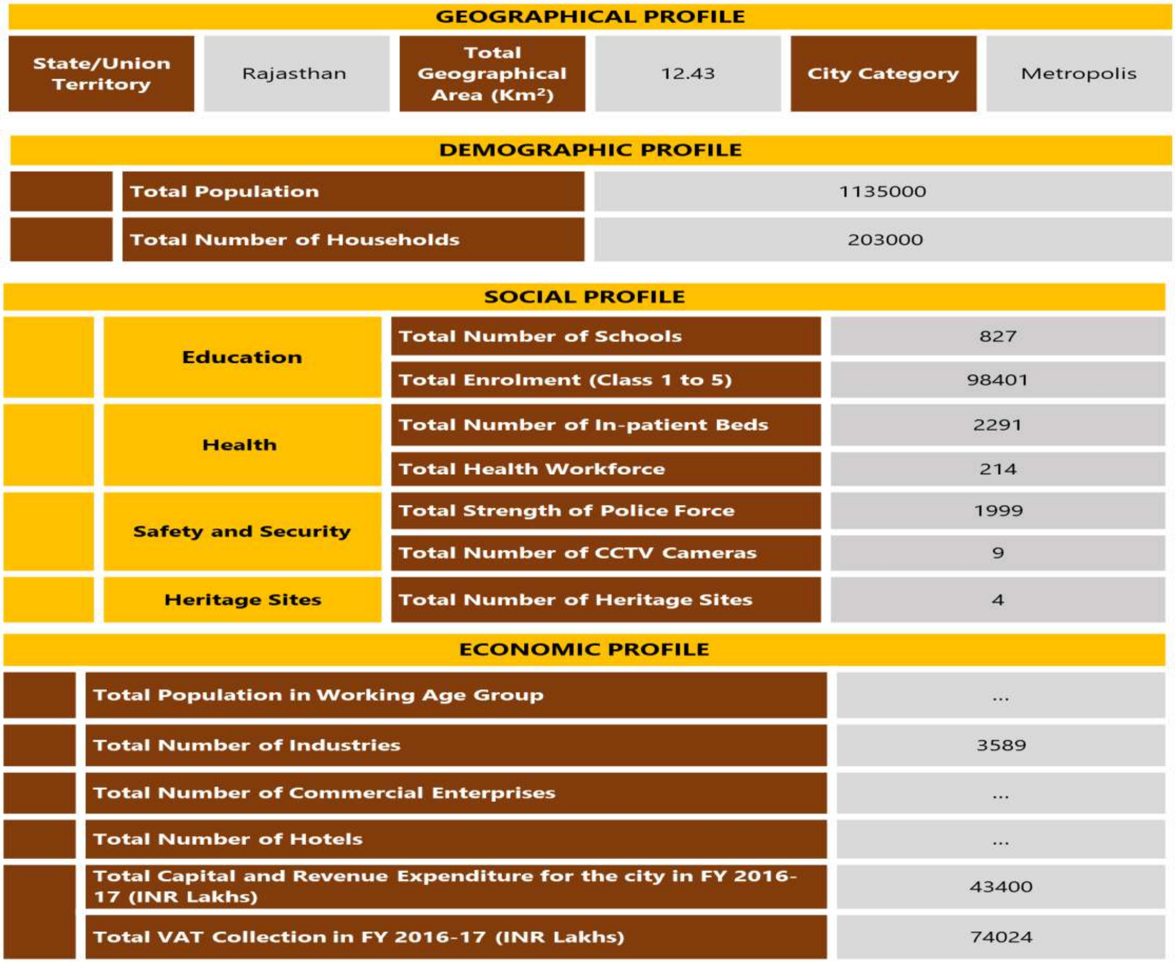
The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

KOTA



GEOGRAPHICAL PROFILE

State/Union Territory	Rajasthan	**Total Geographical Area (Km²)**	12.43	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

	Total Population	1135000
	Total Number of Households	203000

SOCIAL PROFILE

	Education	**Total Number of Schools**	827
		Total Enrolment (Class 1 to 5)	98401
	Health	**Total Number of In-patient Beds**	2291
		Total Health Workforce	214
	Safety and Security	**Total Strength of Police Force**	1999
		Total Number of CCTV Cameras	9
	Heritage Sites	**Total Number of Heritage Sites**	4

ECONOMIC PROFILE

	Total Population in Working Age Group	…
	Total Number of Industries	3589
	Total Number of Commercial Enterprises	…
	Total Number of Hotels	…
	Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	43400
	Total VAT Collection in FY 2016-17 (INR Lakhs)	74024

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	271
		Total Number of Water Connections	148150
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	5619
		Total number of households in the city with access to community toilets in the city	...
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	600
		Total number of households covered through door-to-door collection of solid waste	230000
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	108
		Daily average quantum of waste water treated by STPs in the city (MLD)	10
	Electricity	**Total number of authorized electrical connections in the city**	191659
		Total electricity supplied to the city (kWh)	1202110000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	...
	Roads and Transport	**Total Length of Road Network in the City (Km)**	...
		Total length of arterial and sub-arterial road network in the city (Km)	...
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary

Pillars of Comprehensive Development	Category	Indicators
		education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational

Pillars of Comprehensive Development	Category	Indicators
		places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System

Pillars of Comprehensive Development	Category	Indicators
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse

Pillars of Comprehensive Development	Category	Indicators
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

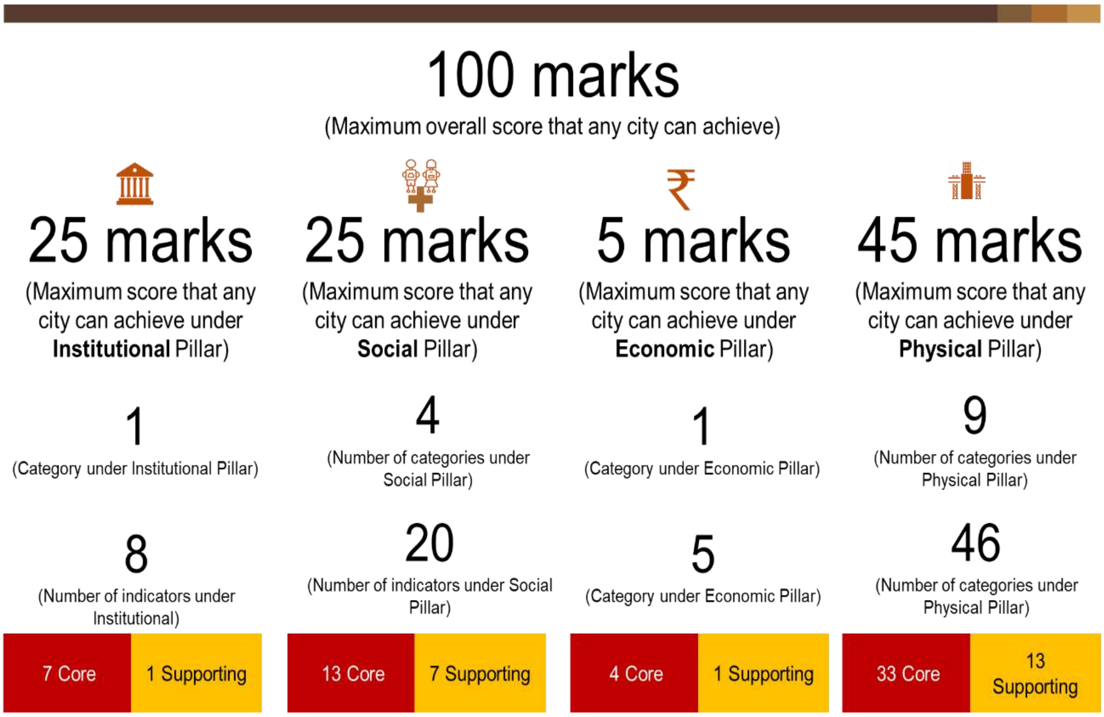
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account department
Urban Local Body	For Park and Recreation Related Questions	Chief Medical And Health Officer
Urban Local Body	For Water Supply and Drainage related questions	Public Health and Engineering Department
Urban Local Body	For Heritage sites related data	Urban Improvement Trust
Urban Local Body	For Ecological sites related data	Tourism department
Urban Local Body	For Housing related data	Town Plan Department
Urban Local Body	For Building plan related data	Town Plan Department
Urban Local Body	For Roads related data	Regional Transport Office
Urban Local Body	For Solid waste management related data	Urban Local Body
Urban Local Body	For IT services related data	Urban Local Body
Urban Local Body	For Vendor committee related data	Urban Local Body
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	NO
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution control board
Development Authority	Building Infrastructure	Town Plan Department
	Construction planning	Town Plan Department
	Green Building	Urban Improvement Trust
	Rain water harvesting	Urban Local Body
	Universal Design Principle	Urban Local Body
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	KDEL department (JVVNL)
State Disaster management authority		Fire brigade

Designated data owners	Subcategories	Data owners at city level
State Education Department		District Education Officer
State Health Department	Health care professionals	Chief Medical And Health Officer
	Citizen Services	Chief Medical And Health Officer
	Disease Prevalence	Chief Medical And Health Officer
	Health Infrastructure	Chief Medical And Health Officer
State Renewable Energy Development Agency		Rajasthan Renewable energy corporation
State Sales / Commercial Taxes Department		Office Joint Commissioner State Commissioner of commerce, Kota
Town and Country Planning Department	Land Use	Town Plan Department
Traffic and Police Department		City SP
Transport Authorities	Buses	Central Bus Stand
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 21 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**1**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**1**
Development Authority	**0**
Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**0**
State Health Department	**3**
Transport Authority	**3**
Disaster Management	**0**
Urban Local Body	**12**
Total	**21***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	40.62%
Identity & Culture	27%
Education	81%
Health	46%
Safety & Security	49%
Economy & Employment	11%
Housing & Inclusiveness	2%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	39%
Transport & Mobility	20%
Assured Water Supply	64%
Waste Water Management	4%
Solid Waste Management	71%
Reduced Pollution	81%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

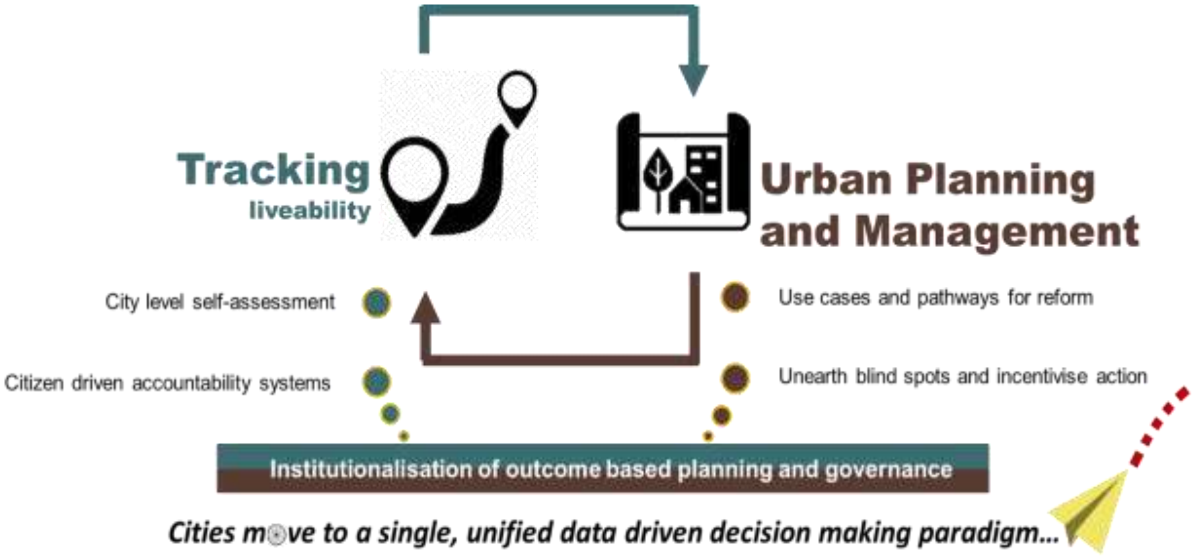
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

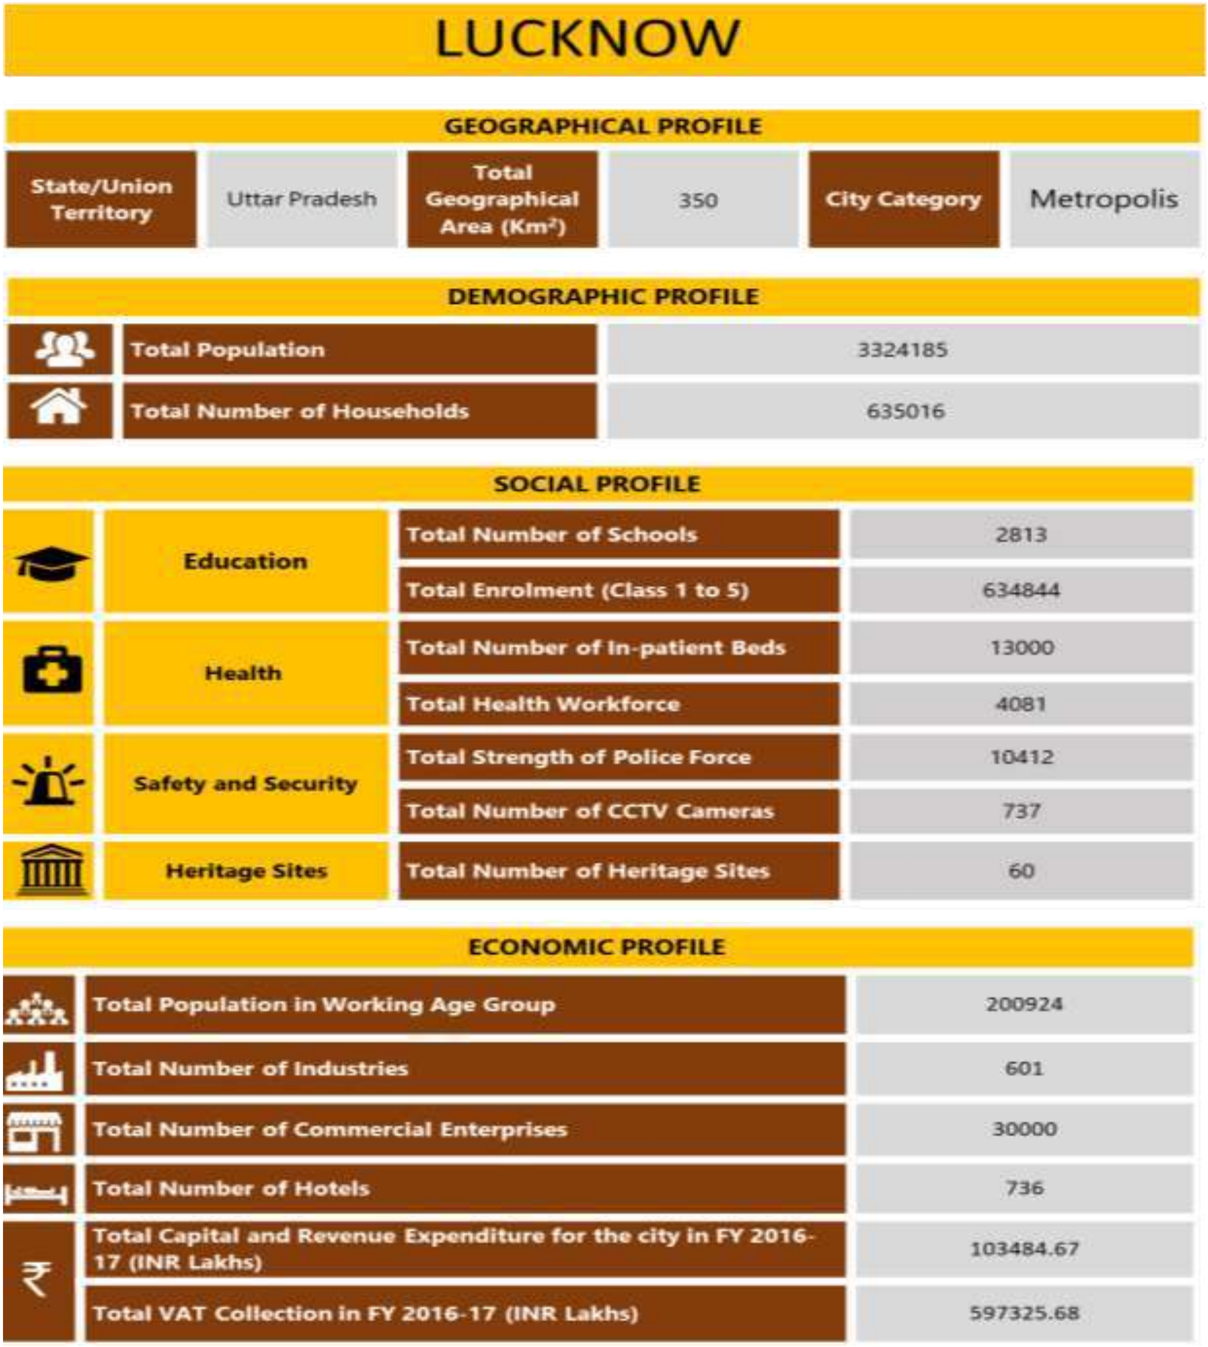


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



LUCKNOW

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	Total Geographical Area (Km²)	350	City Category	Metropolis

DEMOGRAPHIC PROFILE

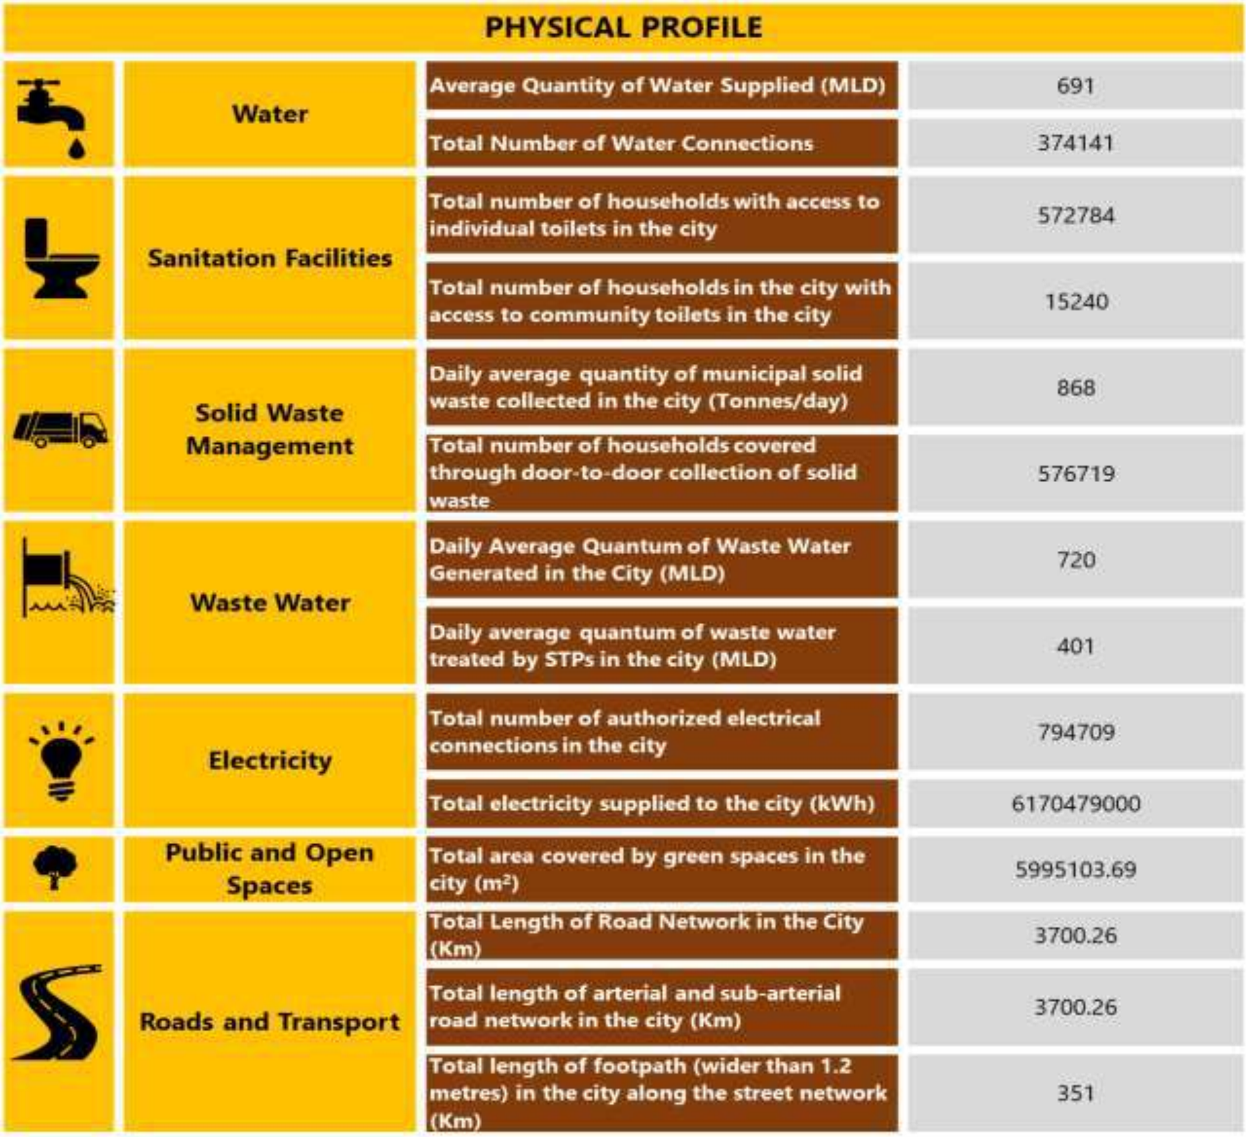
Total Population	3324185
Total Number of Households	635016

SOCIAL PROFILE

Education	Total Number of Schools	2813
	Total Enrolment (Class 1 to 5)	634844
Health	Total Number of In-patient Beds	13000
	Total Health Workforce	4081
Safety and Security	Total Strength of Police Force	10412
	Total Number of CCTV Cameras	737
Heritage Sites	Total Number of Heritage Sites	60

ECONOMIC PROFILE

Total Population in Working Age Group	200924
Total Number of Industries	601
Total Number of Commercial Enterprises	30000
Total Number of Hotels	736
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	103484.67
Total VAT Collection in FY 2016-17 (INR Lakhs)	597325.68



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	691
	Total Number of Water Connections	374141
Sanitation Facilities	Total number of households with access to individual toilets in the city	572784
	Total number of households in the city with access to community toilets in the city	15240
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	868
	Total number of households covered through door-to-door collection of solid waste	576719
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	720
	Daily average quantum of waste water treated by STPs in the city (MLD)	401
Electricity	Total number of authorized electrical connections in the city	794709
	Total electricity supplied to the city (kWh)	6170479000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	5995103.69
Roads and Transport	Total Length of Road Network in the City (Km)	3700.26
	Total length of arterial and sub-arterial road network in the city (Km)	3700.26
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	351

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Pillars of Comprehensive Development	Category	Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

Pillars of Comprehensive Development	Category	Indicators
		reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

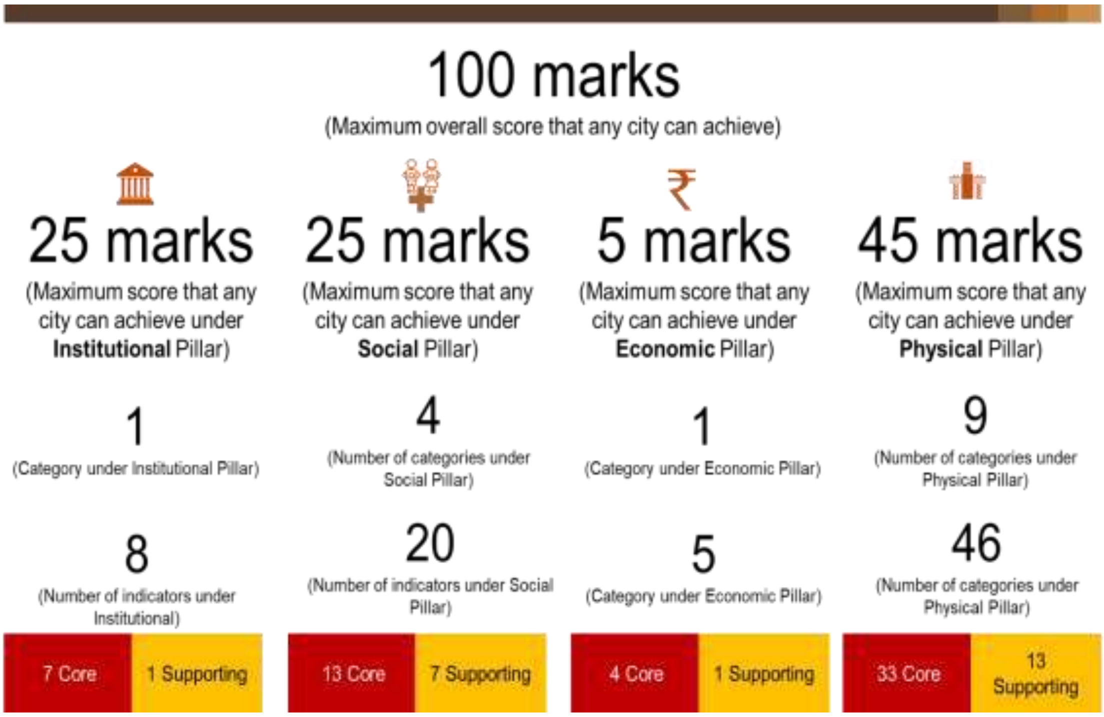
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	MFO, Lucknow Nagar Nigam
Urban Local Body	For Park and Recreation Related Questions	Garden Drpartment, Lucknow Nagar Nigam
Urban Local Body	For Water Supply and Drainage related questions	GPCU
Urban Local Body	For Heritage sites related data	Uttar Pradesh State Archeological Department
Urban Local Body	For Ecological sites related data	Lucknow Nagar Nigam
Urban Local Body	For Housing related data	DUDA
Urban Local Body	For Building plan related data	Lucknow Development Authority
Urban Local Body	For Roads related data	Engineering Department, Lucknow Nagar Nigam
Urban Local Body	For Solid waste management related data	Lucknow Nagar Nigam
Urban Local Body	For IT services related data	Lucknow Nagar Nigam
Urban Local Body	For Vendor committee related data	Lucknow Nagar Nigam
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	DUDA, LDA, Water works deptt.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh Pollution Control Board
Development Authority	Building Infrastructure	Lucknow Development Authority

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Lucknow Development Authority
	Green Building	Lucknow Development Authority
	Rain water harvesting	Lucknow Development Authority
	Universal Design Principle	Lucknow Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Lucknow Electricity Supply Administration
State Disaster management authority		Nodal Officer/ADM
State Education Department		Basic Education Department Lucknow
State Health Department	Health care professionals	CMO Office
	Citizen Services	CMO Office
	Disease Prevalence	CMO Office
	Health Infrastructure	CMO Office
State Renewable Energy Development Agency	Renewable Energy	UP New energy Development Agency
State Sales / Commercial Taxes Department		Commercial Tax Department
Town and Country Planning Department	Land Use	Town and Country Planning
Traffic and Police Department		DCRB
Transport Authorities	Buses	Lucknow City Transport Service Limited
	Registered Vehicles	RTO office
	Sub urban rail transport	N.A
	Mono Rail Authority	N.A
	Tramways	N.A
	Marine Transport Authority	N.A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 50 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**3**
Traffic and Police Department	**7**
Development Authority	**1**
Pollution Control Board	**2**
State Renewable Energy Department	**0**
Town and Country Planning	**1**
State Health Department	**1**
Transport Authority	**8**
Disaster Management	**0**
Urban Local Body	**25**
Total	**50***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.4 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	60.54%
Identity & Culture	20%
Education	85%
Health	59%
Safety & Security	41%
Economy & Employment	15%
Housing & Inclusiveness	7%
Public Open Spaces	10%
Mixed Land Use & Compactness	1%
Power Supply	48%
Transport & Mobility	35%
Assured Water Supply	76%
Waste Water Management	54%
Solid Waste Management	69%
Reduced Pollution	84%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

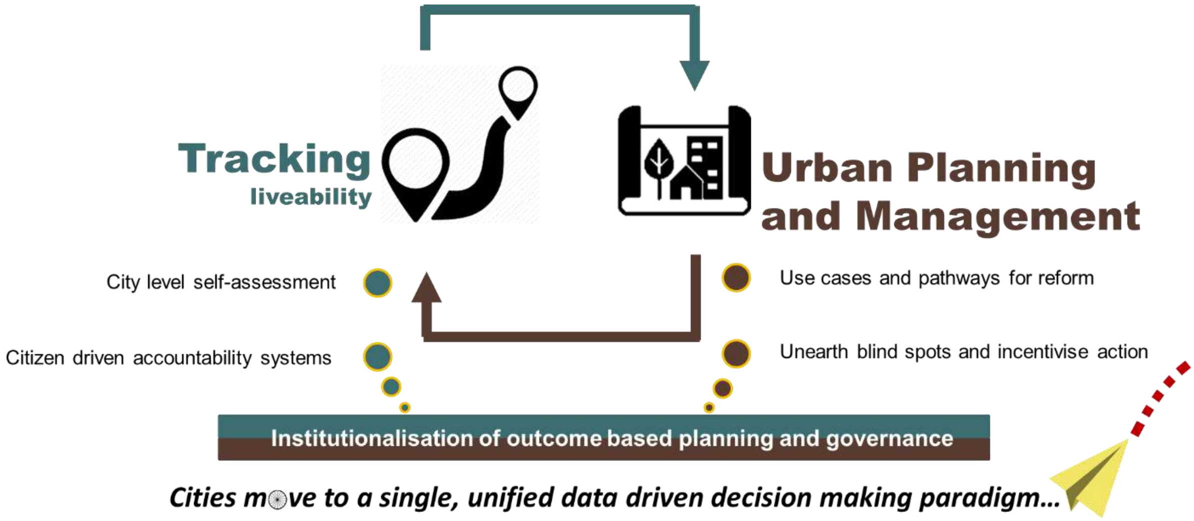
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

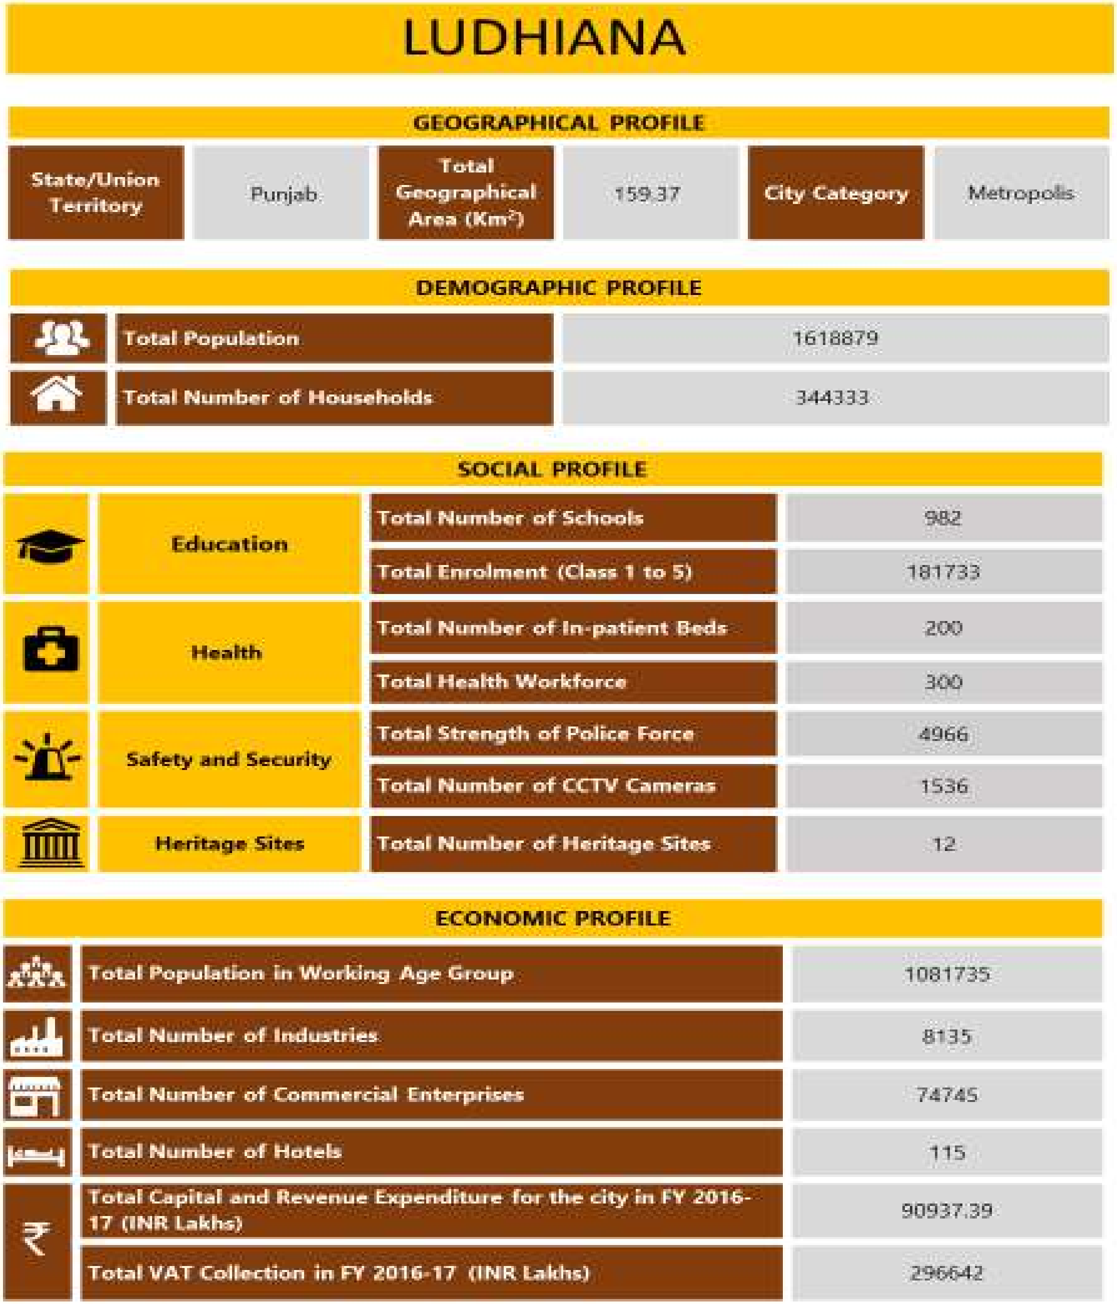


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



LUDHIANA

GEOGRAPHICAL PROFILE

State/Union Territory	Punjab	Total Geographical Area (Km^2)	159.37	City Category	Metropolis

DEMOGRAPHIC PROFILE

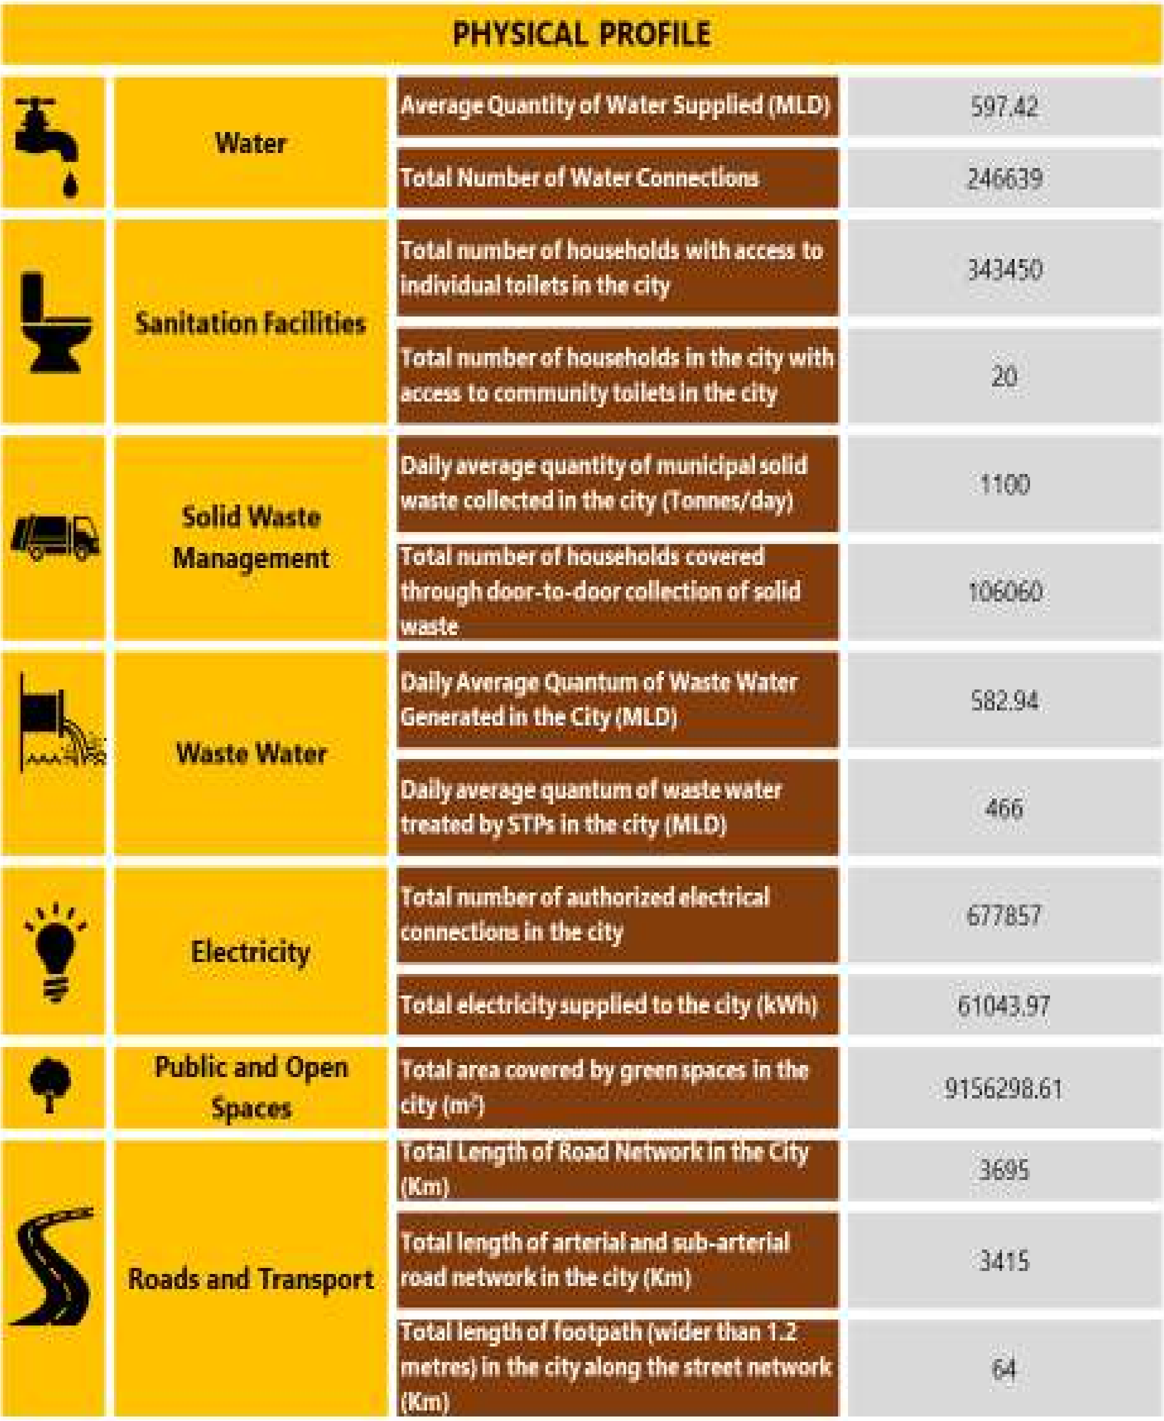
Total Population	1618879
Total Number of Households	344333

SOCIAL PROFILE

Education	Total Number of Schools	982
	Total Enrolment (Class 1 to 5)	181733
Health	Total Number of In-patient Beds	200
	Total Health Workforce	300
Safety and Security	Total Strength of Police Force	4966
	Total Number of CCTV Cameras	1536
Heritage Sites	Total Number of Heritage Sites	12

ECONOMIC PROFILE

Total Population in Working Age Group	1081735
Total Number of Industries	8135
Total Number of Commercial Enterprises	74745
Total Number of Hotels	115
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	90937.39
Total VAT Collection in FY 2016-17 (INR Lakhs)	296642



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	597.42
	Total Number of Water Connections	246639
Sanitation Facilities	Total number of households with access to individual toilets in the city	343450
	Total number of households in the city with access to community toilets in the city	20
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	1100
	Total number of households covered through door-to-door collection of solid waste	106060
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	582.94
	Daily average quantum of waste water treated by STPs in the city (MLD)	466
Electricity	Total number of authorized electrical connections in the city	677857
	Total electricity supplied to the city (kWh)	61043.97
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	9156298.61
Roads and Transport	Total Length of Road Network in the City (Km)	3695
	Total length of arterial and sub-arterial road network in the city (Km)	3415
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	64

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 2 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city

Pillars of Comprehensive Development	Category	Indicators
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	Compactness	
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW

Pillars of Comprehensive Development	Category	Indicators
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 3 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 4:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, Municipal Corporation Ludhiana
Urban Local Body	For Park and Recreation Related Questions	Horticulture Department, Municipal Corporation Ludhiana
Urban Local Body	For Water Supply and Drainage related questions	Water Supply and Sewerage, Municipal Corporation Ludhiana
Urban Local Body	For Heritage sites related data	No heritage sites available in Ludhiana
Urban Local Body	For Ecological sites related data	No ecological sites available in Ludhiana
Urban Local Body	For Housing related data	Census Department, Municipal Corporation Ludhiana
Urban Local Body	For Building plan related data	Municipal Town Planning, Municipal Corporation Ludhiana
Urban Local Body	For Roads related data	B&R Department, Municipal Corporation Ludhiana
Urban Local Body	For Solid waste management related data	Municipal Health and Sanitation Wing, Municipal Corporation Ludhiana
Urban Local Body	For IT services related data	IT department, Municipal Corporation Ludhiana
Urban Local Body	For Vendor committee related data	Tehbazari Department, Municipal Corporation Ludhiana
Urban Local Body	Any other departments involved in providing data for questions mentioned under	• District Sports Office • Employment Exchange • District Transport Office

Designated data owners	Subcategories	Data owners at city level
	Urban Local Body	- Traffic and Police Department - Property Tax Department
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Punjab Pollution Control Board
Development Authority	Building Infrastructure	District Town Planning
	Construction planning	District Town Planning
	Green Building	District Town Planning
	Rain water harvesting	District Town Planning
	Universal Design Principle	District Town Planning
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Punjab State Power Corporation Limited
State Disaster management authority		Revenue Department
State Education Department		State Education Department
State Health Department	Health care professionals	State Health Department
State Health Department	Citizen Services	State Health Department
State Health Department	Disease Prevalence	State Health Department
State Health Department	Health Infrastructure	State Health Department
State Renewable Energy Development Agency		Punjab Energy Development Agency
State Sales / Commercial Taxes Department		Excise Department and Taxations Department, Ludhiana
Town and Country Planning Department	Land Use	District and Town Planning, Ludhiana
Traffic and Police Department		Traffic and Police Department, Ludhiana
Transport Authorities	Buses	City Bus Services, Ludhiana
Transport Authorities	Registered Vehicles	District Transport Office, Ludhiana
Transport Authorities	Sub urban rail transport	Not Applicable
Transport Authorities	Mono Rail Authority	Not Applicable
Transport Authorities	Tramways	Not Applicable
Transport Authorities	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 177 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 5: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	3
State Education Department	7
DISCOM/Electricity Department	14
Traffic and Police Department	5
Development Authority	1
Pollution Control Board	8
State Renewable Energy Department	0
Town and Country Planning	6
State Health Department	16
Transport Authority	12
Disaster Management	0
Urban Local Body	105
Total	177

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 6: Category wise scores

Categories	Scores in Percentage
Governance	52.13%
Identity & Culture	59%
Education	90%
Health	58%
Safety & Security	57%
Economy & Employment	27%
Housing & Inclusiveness	14%
Public Open Spaces	24%
Mixed Land Use & Compactness	6%
Power Supply	65%
Transport & Mobility	32%
Assured Water Supply	69%
Waste Water Management	63%
Solid Waste Management	62%
Reduced Pollution	92%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

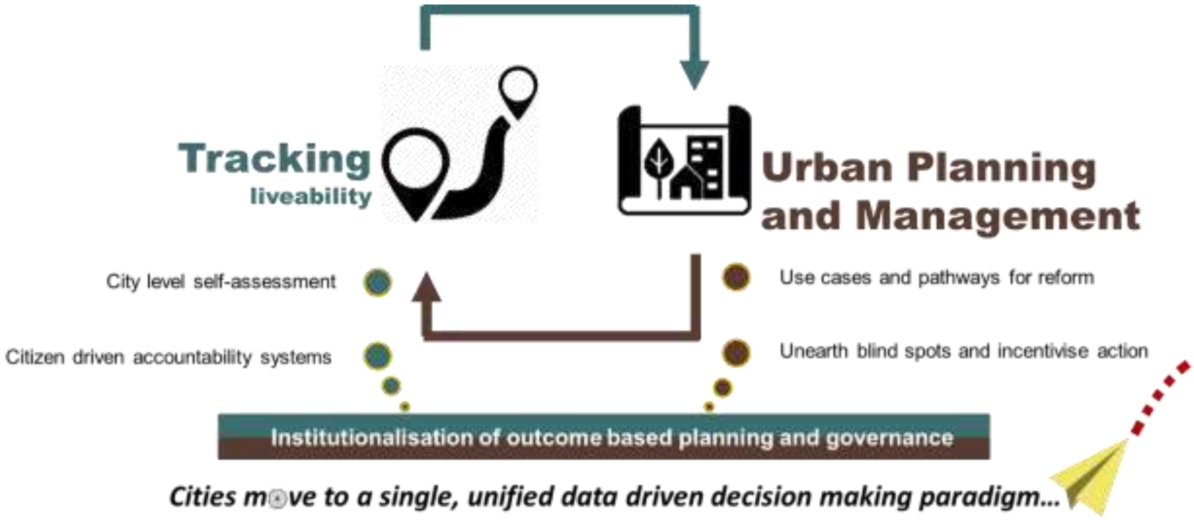
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

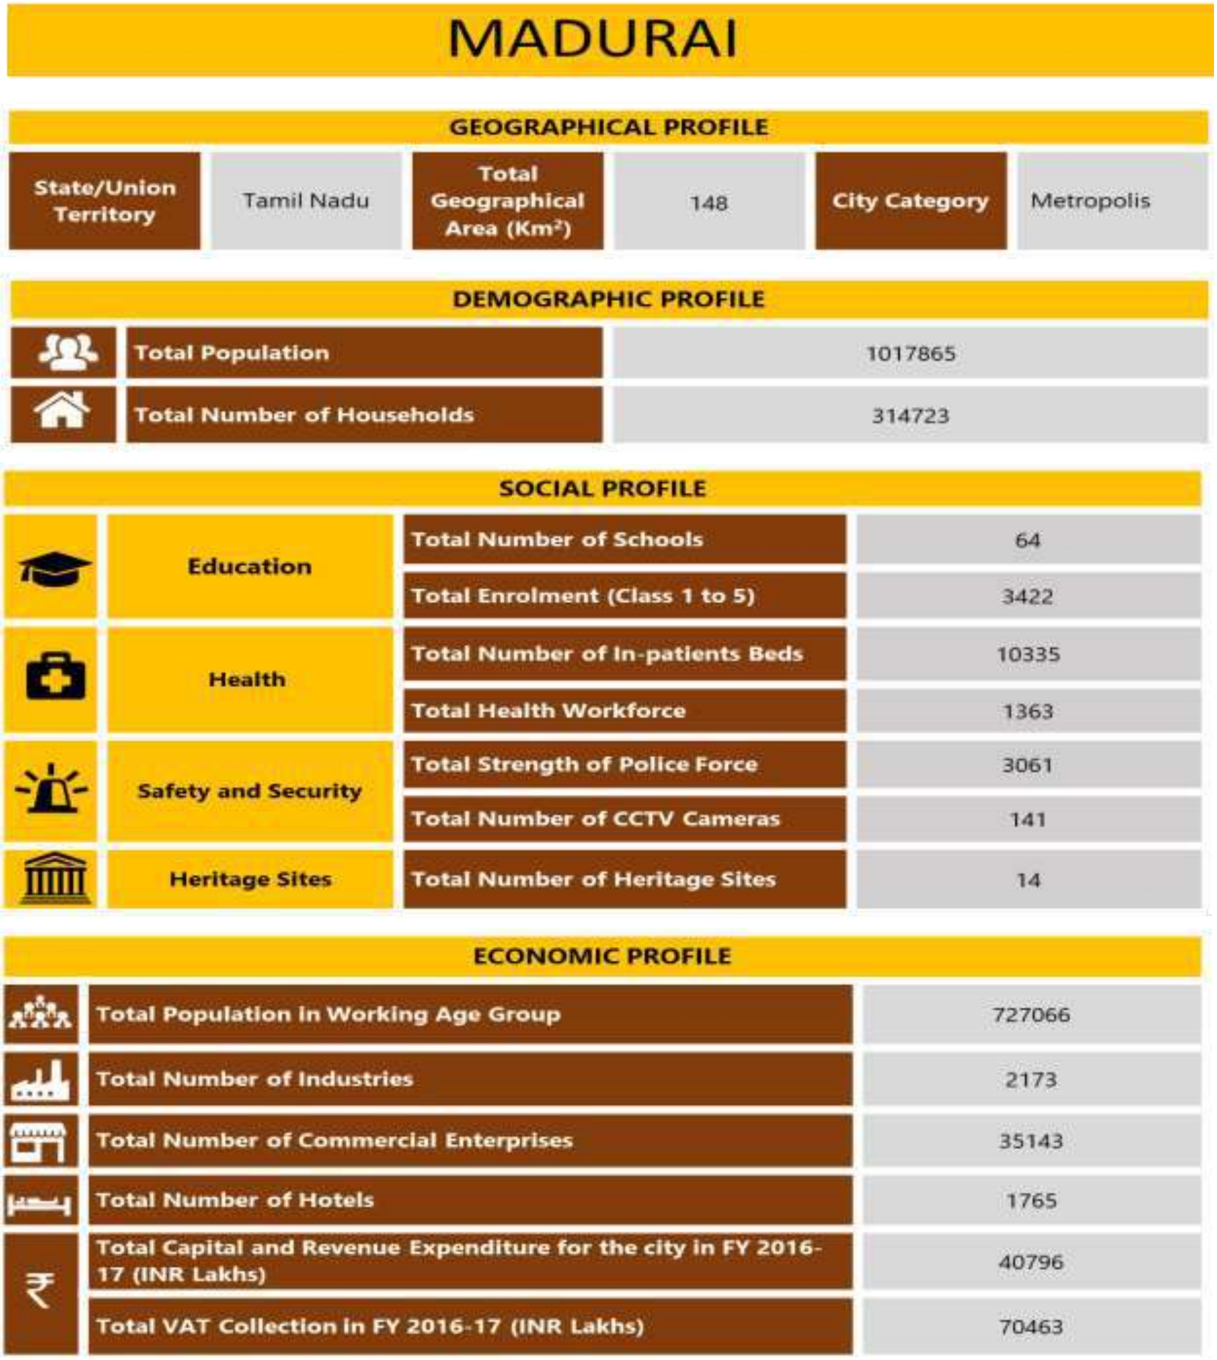


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



MADURAI

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	Total Geographical Area (Km^2)	148	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1017865
Total Number of Households	314723

SOCIAL PROFILE

Education	Total Number of Schools	64
	Total Enrolment (Class 1 to 5)	3422
Health	Total Number of In-patients Beds	10335
	Total Health Workforce	1363
Safety and Security	Total Strength of Police Force	3061
	Total Number of CCTV Cameras	141
Heritage Sites	Total Number of Heritage Sites	14

ECONOMIC PROFILE

Total Population in Working Age Group	727066
Total Number of Industries	2173
Total Number of Commercial Enterprises	35143
Total Number of Hotels	1765
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	40796
Total VAT Collection in FY 2016-17 (INR Lakhs)	70463

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	148
	Total Number of Water Connections	152365
Sanitation Facilities	Total number of households with access to individual toilets in the city	292312
	Total number of households in the city with access to community toilets in the city	400
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	650
	Total number of households covered through door-to-door collection of solid waste	314723
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	120
	Daily average quantum of waste water treated by STPs in the city (MLD)	50
Electricity	Total number of authorized electrical connections in the city	602272
	Total electricity supplied to the city (kWh)	1327353
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	36.75
Roads and Transport	Total Length of Road Network in the City (Km)	1640
	Total length of arterial and sub-arterial road network in the city (Km)	1572.53
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	163

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

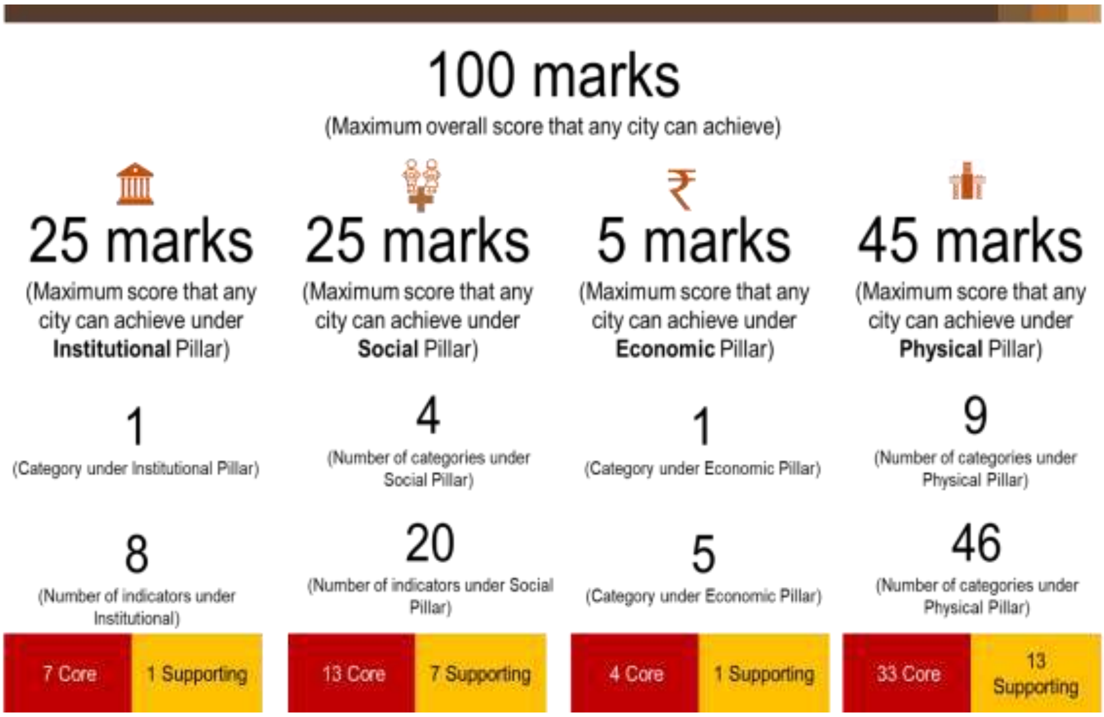
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Engineering Section
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section
Urban Local Body	For Heritage sites related data	Town planning
Urban Local Body	For Ecological sites related data	Town planning
Urban Local Body	For Housing related data	Town planning
Urban Local Body	For Building plan related data	Town planning
Urban Local Body	For Roads related data	Engineering Section
Urban Local Body	For Solid waste management related data	Health Department
Urban Local Body	For IT services related data	IT department
Urban Local Body	For Vendor committee related data	Town planning
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban	Revenue Section

Designated data owners	Subcategories	Data owners at city level
	Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	
Development Authority	Building Infrastructure	Town planning
	Construction planning	Town planning
	Green Building	Town planning
	Rain water harvesting	Town planning
	Universal Design Principle	Engineering Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		Revenue and Disaster Management Department
State Education Department		Education Department
State Health Department	Health care professionals	City Health Office
	Citizen Services	City Health Office
	Disease Prevalence	City Health Office
	Health Infrastructure	City Health Office
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		District Commercial Tax Department
Town and Country Planning Department	Land Use	Town Planning
Traffic and Police Department		Police Department
Transport Authorities	Buses	Tamilnadu State Transport Corporation
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 65 number of documents. Documents submitted include reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	4
DISCOM/Electricity Department	7
Traffic and Police Department	2
Development Authority	7
Pollution Control Board	2
State Renewable Energy Department	1
Town and Country Planning	3
State Health Department	7
Transport Authority	6
Disaster Management	1
Urban Local Body	24
Total	65*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	56.13%
Identity & Culture	62%
Education	52%
Health	89%
Safety & Security	49%
Economy & Employment	8%
Housing & Inclusiveness	45%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	65%
Transport & Mobility	29%
Assured Water Supply	91%
Waste Water Management	85%
Solid Waste Management	70%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

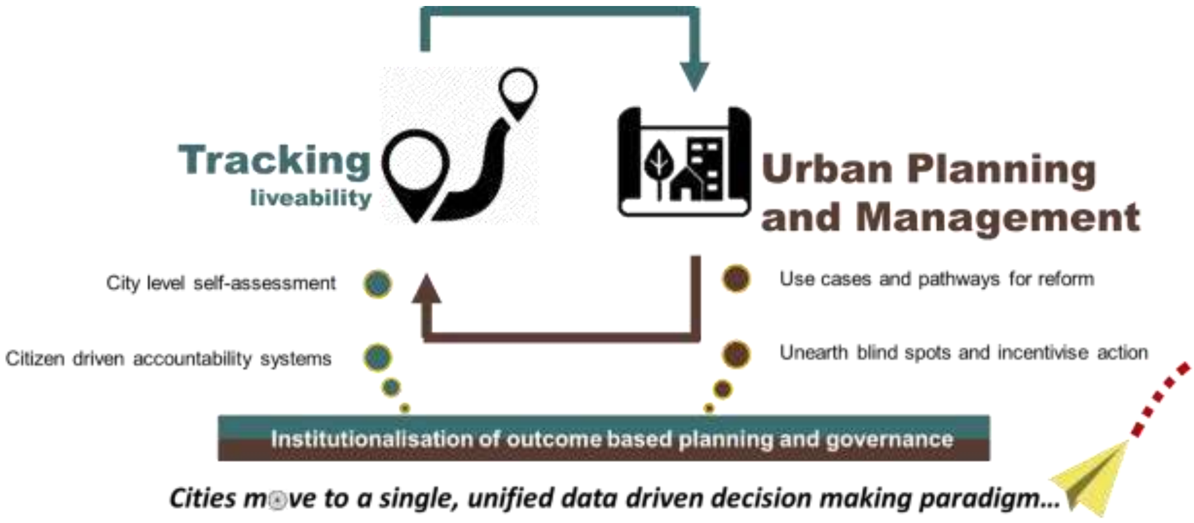
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

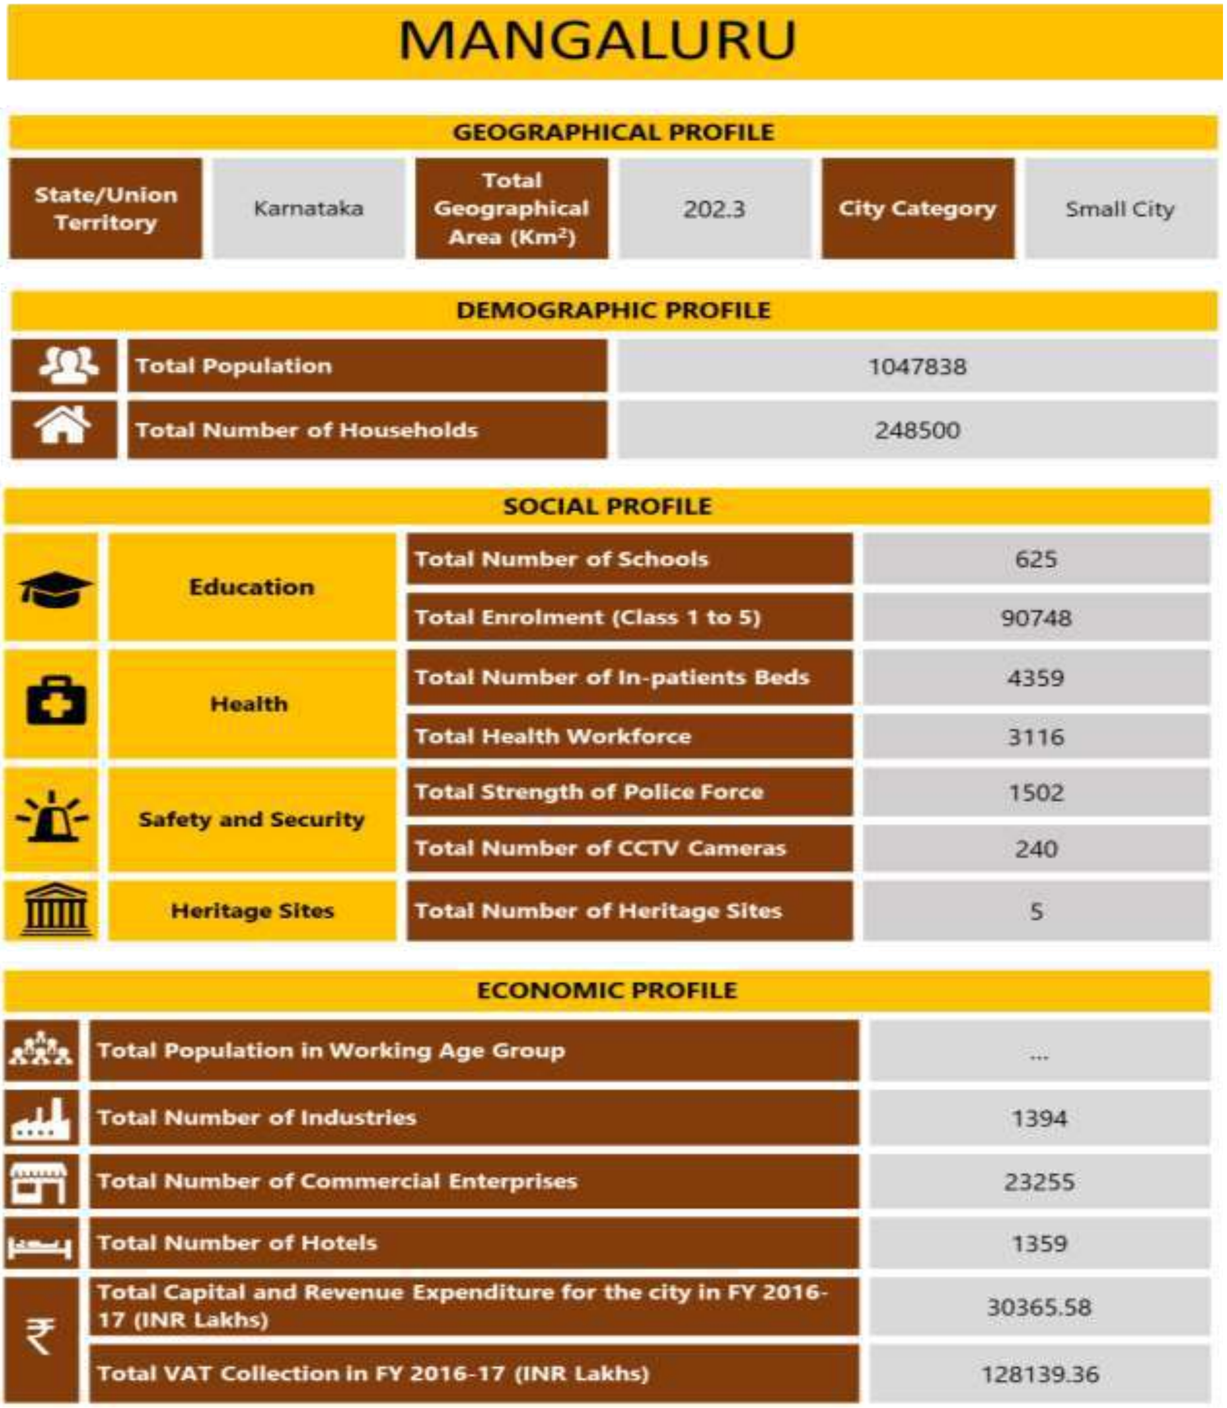


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



MANGALURU

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	Total Geographical Area (Km²)	202.3	City Category	Small City

DEMOGRAPHIC PROFILE

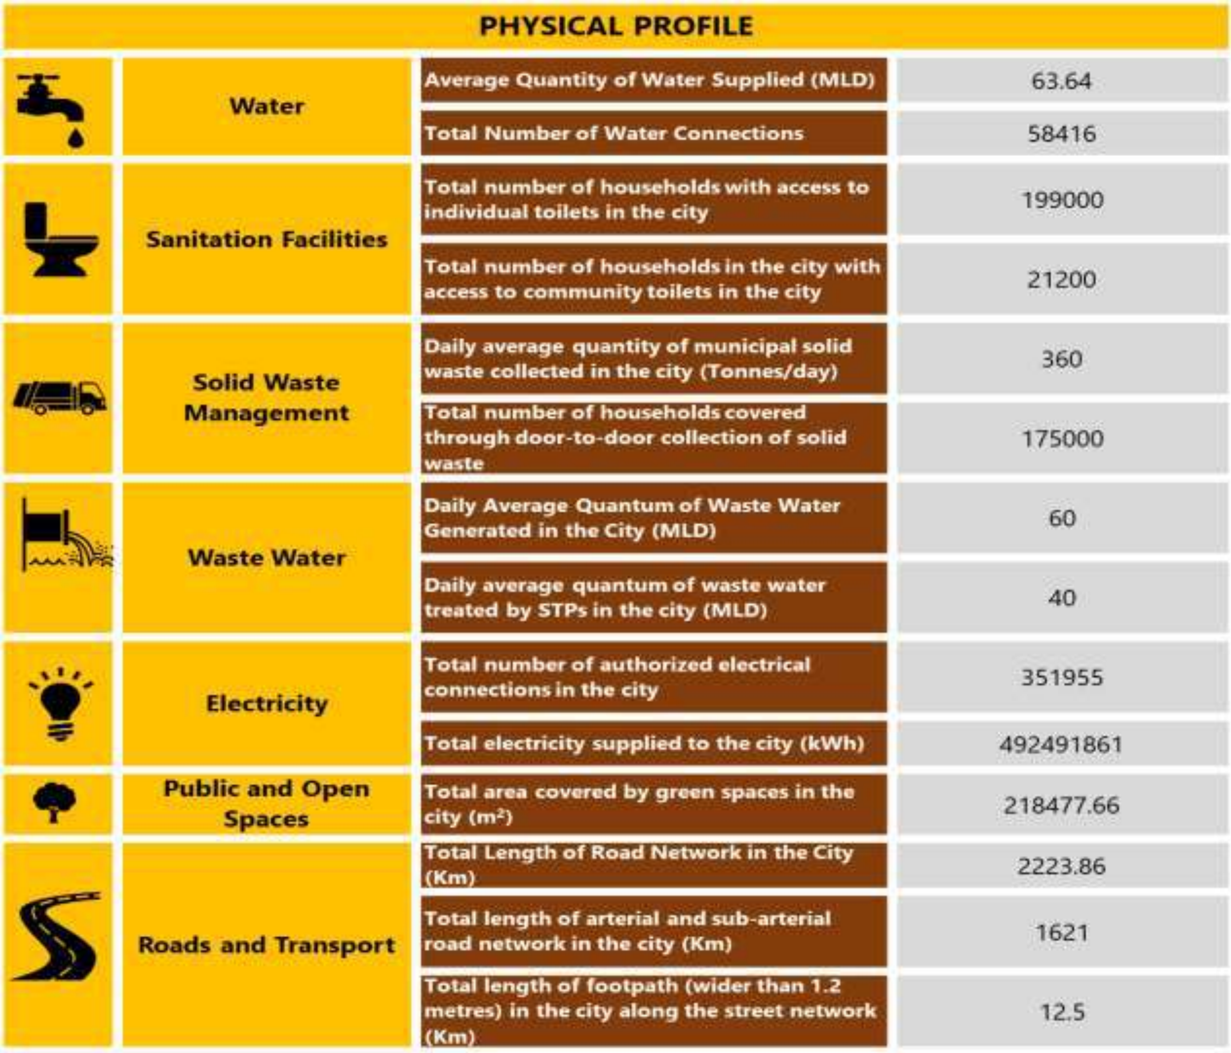
Total Population	1047838
Total Number of Households	248500

SOCIAL PROFILE

Education	Total Number of Schools	625
	Total Enrolment (Class 1 to 5)	90748
Health	Total Number of In-patients Beds	4359
	Total Health Workforce	3116
Safety and Security	Total Strength of Police Force	1502
	Total Number of CCTV Cameras	240
Heritage Sites	Total Number of Heritage Sites	5

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	1394
Total Number of Commercial Enterprises	23255
Total Number of Hotels	1359
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	30365.58
Total VAT Collection in FY 2016-17 (INR Lakhs)	128139.36



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	63.64
	Total Number of Water Connections	58416
Sanitation Facilities	Total number of households with access to individual toilets in the city	199000
	Total number of households in the city with access to community toilets in the city	21200
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	360
	Total number of households covered through door-to-door collection of solid waste	175000
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	60
	Daily average quantum of waste water treated by STPs in the city (MLD)	40
Electricity	Total number of authorized electrical connections in the city	351955
	Total electricity supplied to the city (kWh)	492491861
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	218477.66
Roads and Transport	Total Length of Road Network in the City (Km)	2223.86
	Total length of arterial and sub-arterial road network in the city (Km)	1621
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	12.5

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

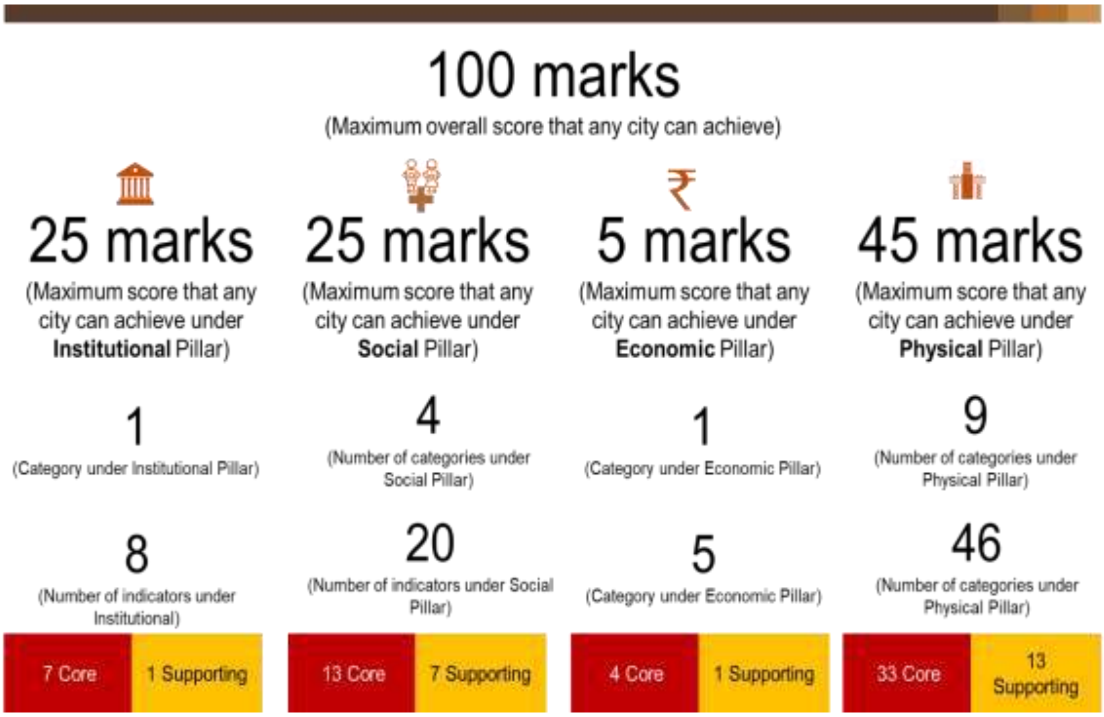
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department MCC
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department MCC
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department MCC
Urban Local Body	For Heritage sites related data	Town Planning Department MCC
Urban Local Body	For Ecological sites related data	Department of forest, ecology and environment
Urban Local Body	For Housing related data	Rajiv Gandhi rural housing corporation limited. MCC
Urban Local Body	For Building plan related data	Town Planning Department MCC
Urban Local Body	For Roads related data	Engineering Department MCC
Urban Local Body	For Solid waste management related data	Environment Department
Urban Local Body	For IT services related data	IT Department
Urban Local Body	For Vendor committee related data	Urban Poverty Alleviation Cell Deendayal Antyodaya Yojana National Urban Livelihood Mission. MCC (DAY_NULM)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Commercial Tax Department (Professional Tax related queries), Education Department (Population of age group between 6-14), Revenue Department, PMAY, District Employment Exchange, Development Authority, DULT (CMP related), KMDS (No. of Hits in the online service portals), Health Department, Pollution Department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution department

Designated data owners	Subcategories	Data owners at city level
Development Authority	Building Infrastructure	Development Authority
	Construction planning	Development Authority and Town Planning Department, MCC
	Green Building	Town Planning Department, MCC
	Rain water harvesting	Town Planning Department, MCC
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Mangalore Electricity Supply Company Limited
State Disaster management authority		District Collector Office
State Education Department		
State Health Department	Health care professionals	District Health Office
	Citizen Services	District Health Office
	Disease Prevalence	District Health Office
	Health Infrastructure	District Health Office
State Renewable Energy Development Agency	Renewable Energy	Mangalore Electricity Supply Company Limited
State Sales / Commercial Taxes Department		Joint Commissioner, Commercial Tax Office
Town and Country Planning Department	Land Use	Development Authority
Traffic and Police Department		Deputy Police Commissioner's Office
Transport Authorities	Buses	Regional Transport Officer Office
	Registered Vehicles	Regional Transport Officer Office
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Urban Local Body

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 149 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

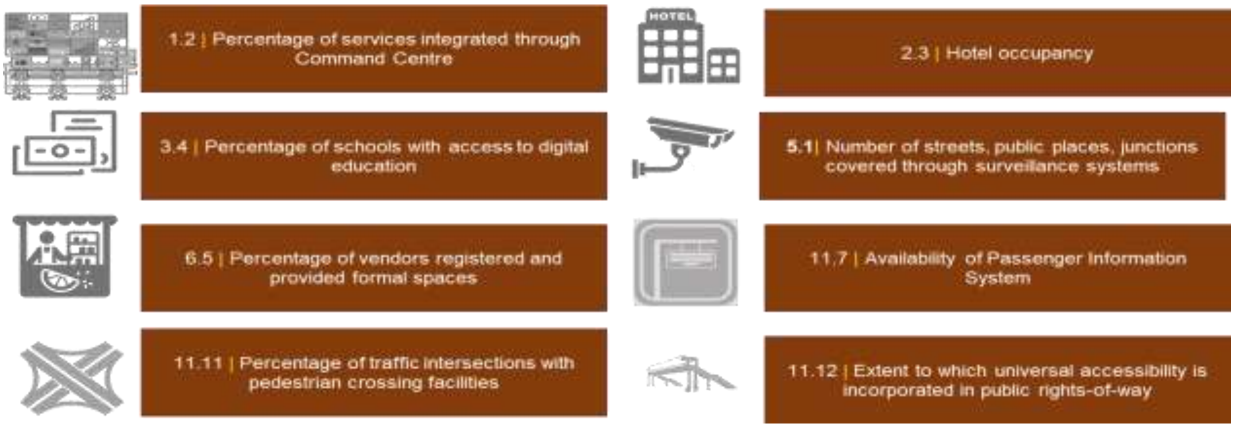
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**6**
DISCOM/Electricity Department	**11**
Traffic and Police Department	**10**
Development Authority	**2**
Pollution Control Board	**7**
State Renewable Energy Department	**1**
Town and Country Planning	**1**
State Health Department	**14**
Transport Authority	**10**
Disaster Management	**1**
Urban Local Body	**84**
Total	**149***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

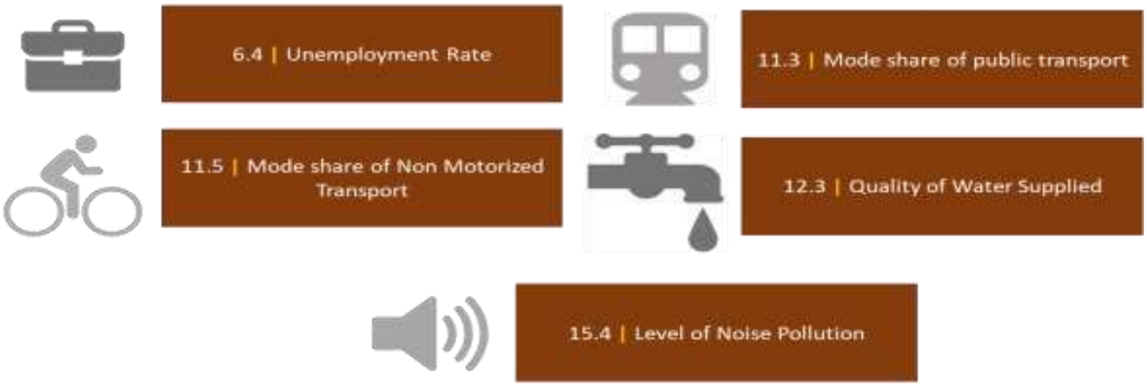
6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. LA - Surveillance Camera
6. LA - Passenger Information Systems
7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	69.23%
Identity & Culture	49%
Education	88%
Health	94%
Safety & Security	60%
Economy & Employment	25%
Housing & Inclusiveness	2%
Public Open Spaces	2%
Mixed Land Use & Compactness	0%
Power Supply	59%
Transport & Mobility	46%
Assured Water Supply	91%
Waste Water Management	65%
Solid Waste Management	98%
Reduced Pollution	87%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

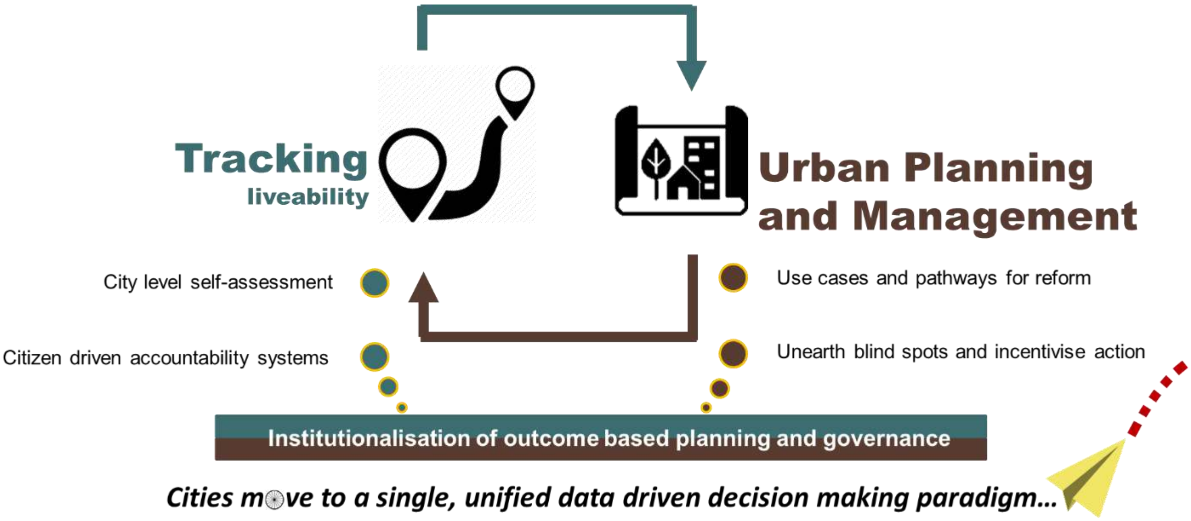
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

MEERUT

GEOGRAPHICAL PROFILE

Roads and Transport	**Total Length of Road Network in the City (Km)**	1427.63
	Total length of arterial and sub-arterial road network in the city (Km)	548.35
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

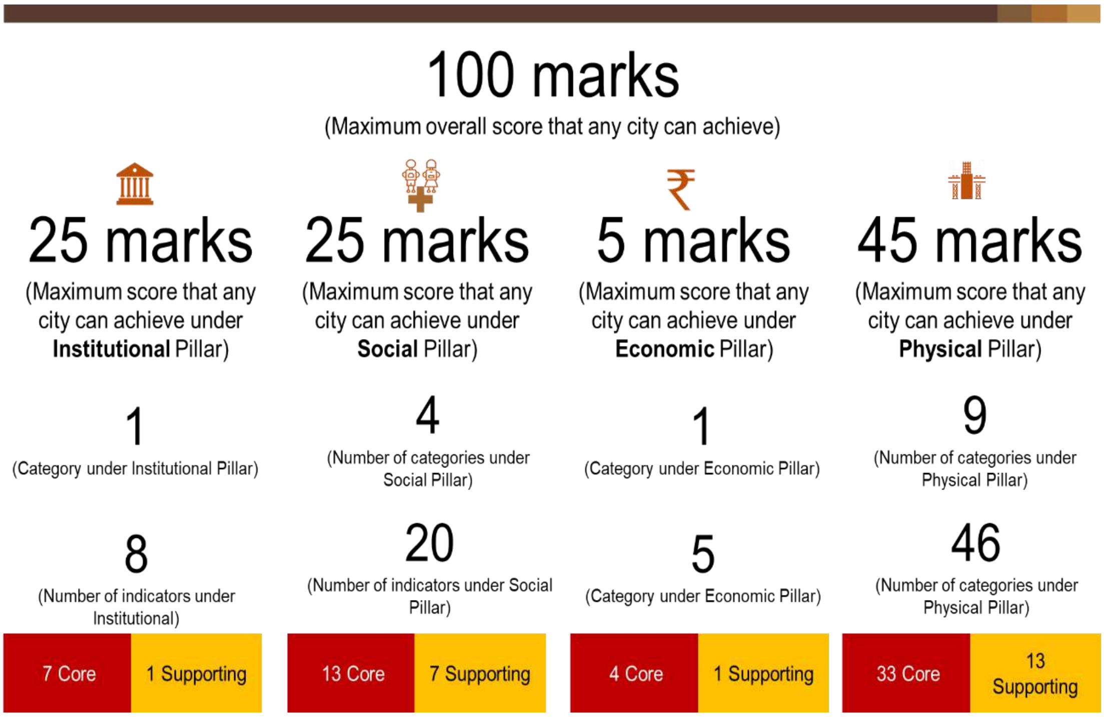
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts section, Meerut Nagar Nigam
Urban Local Body	For Park and Recreation Related Questions	Garden Section, Meerut Nagar Nigam
Urban Local Body	For Water Supply and Drainage related questions	Water supply, Meerut Nagar Nigam
Urban Local Body	For Heritage sites related data	Tourism Department
Urban Local Body	For Ecological sites related data	
Urban Local Body	For Housing related data	Housing, Meerut Nagar Nigam
Urban Local Body	For Building plan related data	Development authority
Urban Local Body	For Roads related data	Development authority, roads
Urban Local Body	For Solid waste management related data	PHED
Urban Local Body	For IT services related data	IT Section, Meerut Nagar Nigam
Urban Local Body	For Vendor committee related data	
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	UP Pollution control Board
Development	Building Infrastructure	Development Authority

Designated data owners	Subcategories	Data owners at city level
Authority		
	Construction planning	Development Authority
	Green Building	Development Authority
	Rain water harvesting	Development Authority
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	DISCOM/Electricity Board
State Disaster management authority		State Disaster management authority
State Education Department		Education department
State Health Department	Health care professionals	Health department
	Citizen Services	Health department
	Disease Prevalence	Health department
	Health Infrastructure	Health department
State Renewable Energy Development Agency	Renewable Energy	State Renewable Energy Development Agency
State Sales / Commercial Taxes Department		State Sales / Commercial Taxes Department
Town and Country Planning Department	Land Use	Town and Country Planning Department
Traffic and Police Department		Traffic and Police Department
Transport Authorities	Buses	Transport Authorities
	Registered Vehicles	RTO
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 12 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**1**
Development Authority	**1**
Pollution Control Board	**1**
State Renewable Energy Department	**1**
Town and Country Planning	**1**
State Health Department	**1**
Transport Authority	**1**
Disaster Management	**1**
Urban Local Body	**1**
Total	**12***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	36.44%
Identity & Culture	26%
Education	35%
Health	85%
Safety & Security	47%
Economy & Employment	13%
Housing & Inclusiveness	0%
Public Open Spaces	31%
Mixed Land Use & Compactness	50%
Power Supply	43%
Transport & Mobility	14%
Assured Water Supply	62%
Waste Water Management	0%
Solid Waste Management	20%
Reduced Pollution	51%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

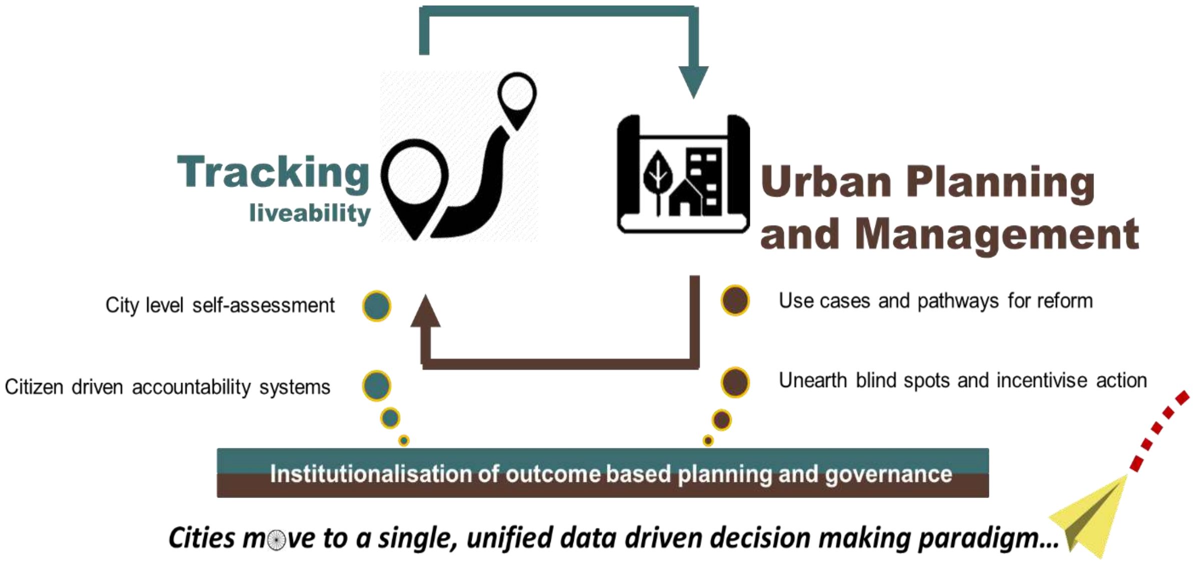
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

MORADABAD

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	349	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	887871
Total Number of Households	129924

SOCIAL PROFILE

Education	**Total Number of Schools**	596
	Total Enrolment (Class 1 to 5)	83230
Health	**Total Number of In-patient Beds**	965
	Total Health Workforce	1349
Safety and Security	**Total Strength of Police Force**	731
	Total Number of CCTV Cameras	20

Total Number of Hotels	48
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	15658.56
Total VAT Collection in FY 2016-17 (INR Lakhs)	24542.29

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	95
	Total Number of Water Connections	110469
Sanitation Facilities	Total number of households with access to individual toilets in the city	161329
	Total number of households in the city with access to community toilets in the city	1294
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	380
	Total number of households covered through door-to-door collection of solid waste	158560
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	…
	Daily average quantum of waste water treated by STPs in the city (MLD)	…
Electricity	Total number of authorized electrical connections in the city	137428
	Total electricity supplied to the city (kWh)	862.549
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	…
Roads and Transport	Total Length of Road Network in the City (Km)	35
	Total length of arterial and sub-arterial road network in the city (Km)	…
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	…

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department, Nagar Nigam Moradabad
Urban Local Body	For Park and Recreation Related Questions	Udyan vibhag, Nagar Nigam Moradabad
Urban Local Body	For Water Supply and Drainage related questions	Jal Nigam/Jalkal, vibhag Nagar Nigam Moradabd
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB
Urban Local Body	For Ecological sites related data	Forest Department Moradabad
Urban Local Body	For Housing related data	Moradabad Development Authority / Nirmaan Vibhag Nagar Nigam Moradabad
Urban Local Body	For Building plan related data	Moradabad Development Authority Moradabad
Urban Local Body	For Roads related data	Public Works Department / Nirmaan Vibhag Nagar Nigam Moradabad
Urban Local Body	For Solid waste management related data	Health Department Nagar Nigam Moradabad
Urban Local Body	For IT services related data	Computer Department. Nagar Nigam Moradabad
Urban Local Body	For Vendor committee related data	District Urban Development Agency(DUDA) Moradabad
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District urban development Agency moradabad
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh pollution Control Board Moradabad
Development Authority	Building Infrastructure	Moradabad development Authority Moradabad
	Construction planning	Moradabad development Authority

Designated data owners	Subcategories	Data owners at city level
		Moradabad
	Green Building	Moradabad development Authority Moradabad
	Rain water harvesting	Moradabad development Authority Moradabad
	Universal Design Principle	Moradabad development Authority Moradabad
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttar Pradesh Power Corporation Ltd Moradabad
State Disaster management authority		State Disaster Management Moradabad [in UP ADM (FR]
State Education Department		Basic Siksha Adhikari/district inspector of school Moradabad (DIOS)
State Health Department	Health care professionals	UP State Health Department Moradabad (CMO)
	Citizen Services	UP State Health Department Moradabad (CMO)
	Disease Prevalence	UP State Health Department Moradabad (CMO)
	Health Infrastructure	UP State Health Department Moradabad (CMO)
State Renewable Energy Development Agency	Renewable Energy	State Renewable Energy Develop. Agency(NEDA)
State Sales / Commercial Taxes Department		Commercial Taxes Department Moradabad Zone
Town and Country Planning Department	Land Use	Town and Country Planning Department Moradabad
Traffic and Police Department		Traffic police, Civil police & Grand Railway police Moradabad
Transport Authorities	Buses	Uttar Pradesh State transport Corporation & Regional Transport Office Moradabad
	Registered Vehicles	Regional Transport Office Moradabad
	Sub urban rail transport	N A
	Mono Rail Authority	N A
	Tramways	N A
	Marine Transport Authority	N A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 27 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**2**
Development Authority	**1**
Pollution Control Board	**1**
State Renewable Energy Department	**1**
Town and Country Planning	**2**
State Health Department	**1**
Transport Authority	**1**
Disaster Management	**1**
Urban Local Body	**14**
Total	**27***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	53.64%
Identity & Culture	16%
Education	77%
Health	68%
Safety & Security	68%
Economy & Employment	21%
Housing & Inclusiveness	2%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	48%
Transport & Mobility	31%
Assured Water Supply	53%
Waste Water Management	20%
Solid Waste Management	66%
Reduced Pollution	74%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

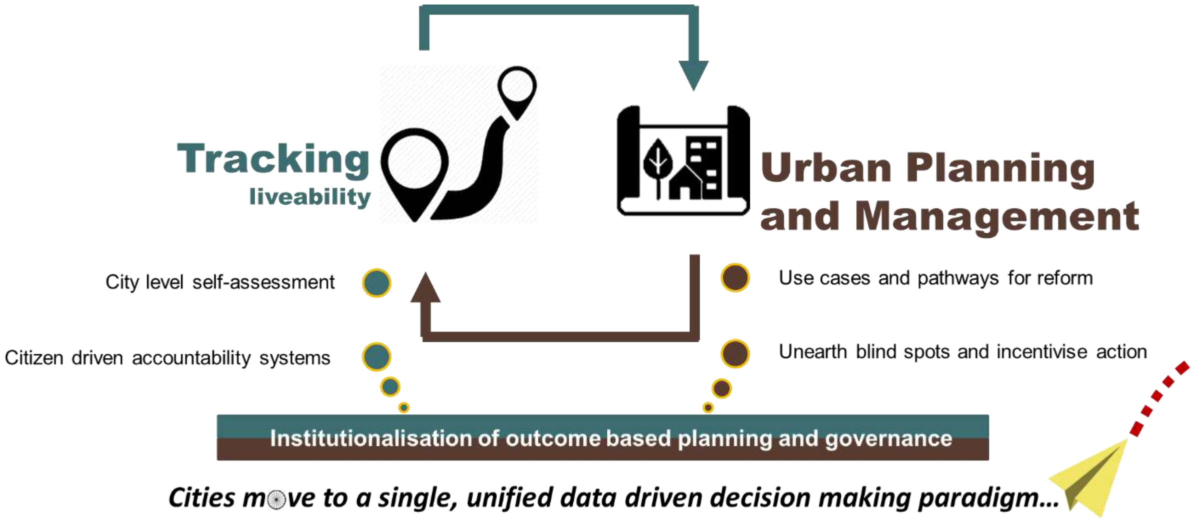
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

MUZAFFARPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Bihar	**Total Geographical Area (Km^2)**	31.72	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	354462
Total Number of Households	69051

SOCIAL PROFILE

Education	**Total Number of Schools**	194
	Total Enrolment (Class 1 to 5)	20680
Health	**Total Number of In-patient Beds**	843
	Total Health Workforce	67
Safety and Security	**Total Strength of Police Force**	303
	Total Number of CCTV Cameras	74
Heritage Sites	**Total Number of Heritage Sites**	36

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	204
Total Number of Commercial Enterprises	5321
Total Number of Hotels	52
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	4972.97
Total VAT Collection in FY 2016-17 (INR Lakhs)	2681.8

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	38.34
	Total Number of Water Connections	26100
Sanitation Facilities	Total number of households with access to individual toilets in the city	63530
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	195
	Total number of households covered through door-to-door collection of solid waste	26521
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	129814
	Total electricity supplied to the city (kWh)	445988
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	10000
Roads and Transport	Total Length of Road Network in the City (Km)	72.18
	Total length of arterial and sub-arterial road network in the city (Km)	72.18
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

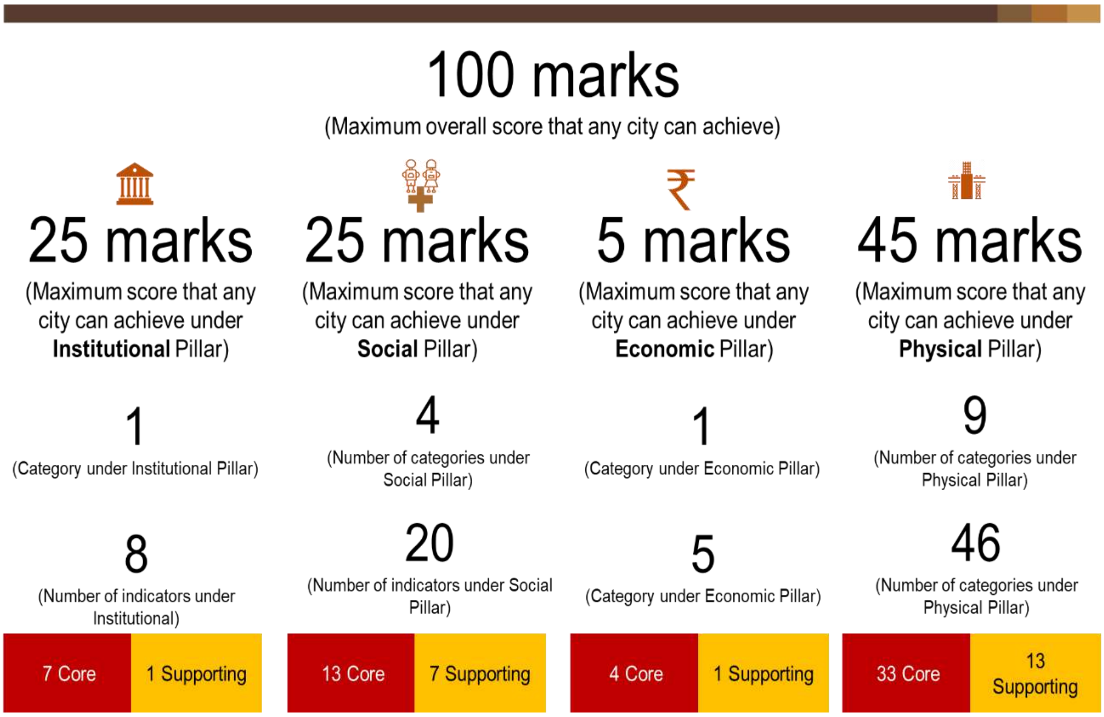
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department, Muzaffarpur Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Department, Muzaffarpur Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Muzaffarpur Municipal Corporation
Urban Local Body	For Heritage sites related data	Muzaffarpur Municipal Corporation
Urban Local Body	For Ecological sites related data	Muzaffarpur Municipal Corporation
Urban Local Body	For Housing related data	Social development Section, Muzaffarpur Municipal Corporation
Urban Local Body	For Building plan related data	Engineering Department, Muzaffarpur Municipal Corporation
Urban Local Body	For Roads related data	Engineering Department, Muzaffarpur Municipal Corporation
Urban Local Body	For Solid waste management related data	Muzaffarpur Municipal Corporation

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For IT services related data	IT section, Muzaffarpur Municipal Corporation
Urban Local Body	For Vendor committee related data	Social Development Section, Muzaffarpur Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board, Bihar
Development Authority	Building Infrastructure	Engineering Department, Muzaffarpur Municipal Corporation
	Construction planning	Engineering Department, Muzaffarpur Municipal Corporation
	Green Building	Engineering Department, Muzaffarpur Municipal Corporation
	Rain water harvesting	Engineering Department, Muzaffarpur Municipal Corporation
	Universal Design Principle	Engineering Department, Muzaffarpur Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bihar Power Distribution Corporation Limited
State Disaster management authority		District Collectorate Office
State Education Department		District Education Department
State Health Department	Health care professionals	Civil Surgeon Office
	Citizen Services	Civil Surgeon Office
	Disease Prevalence	Civil Surgeon Office
	Health Infrastructure	Civil Surgeon Office
State Renewable Energy Development		Bihar Renewable Energy Development Authority

Designated data owners	Subcategories	Data owners at city level
Agency		
State Sales / Commercial Taxes Department		State Commercial and Tax department
Town and Country Planning Department	Land Use	Muzaffarpur Municipal Corporation
Traffic and Police Department		Office of Senior Superintendent of Police
Transport Authorities	Buses	District Transport office
	Registered Vehicles	District Transport office
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 40 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	4
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	5
Transport Authority	0
Disaster Management	0
Urban Local Body	27
Total	40*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	47.83%
Identity & Culture	31%
Education	68%
Health	72%
Safety & Security	59%
Economy & Employment	42%
Housing & Inclusiveness	8%
Public Open Spaces	50%
Mixed Land Use & Compactness	0%
Power Supply	34%
Transport & Mobility	7%
Assured Water Supply	66%
Waste Water Management	39%
Solid Waste Management	51%
Reduced Pollution	52%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

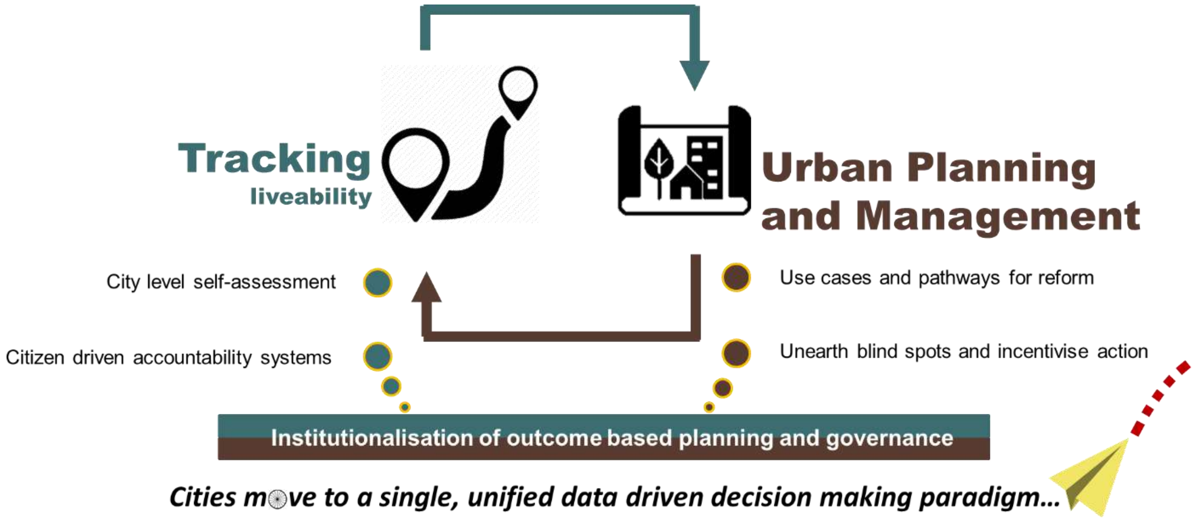
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



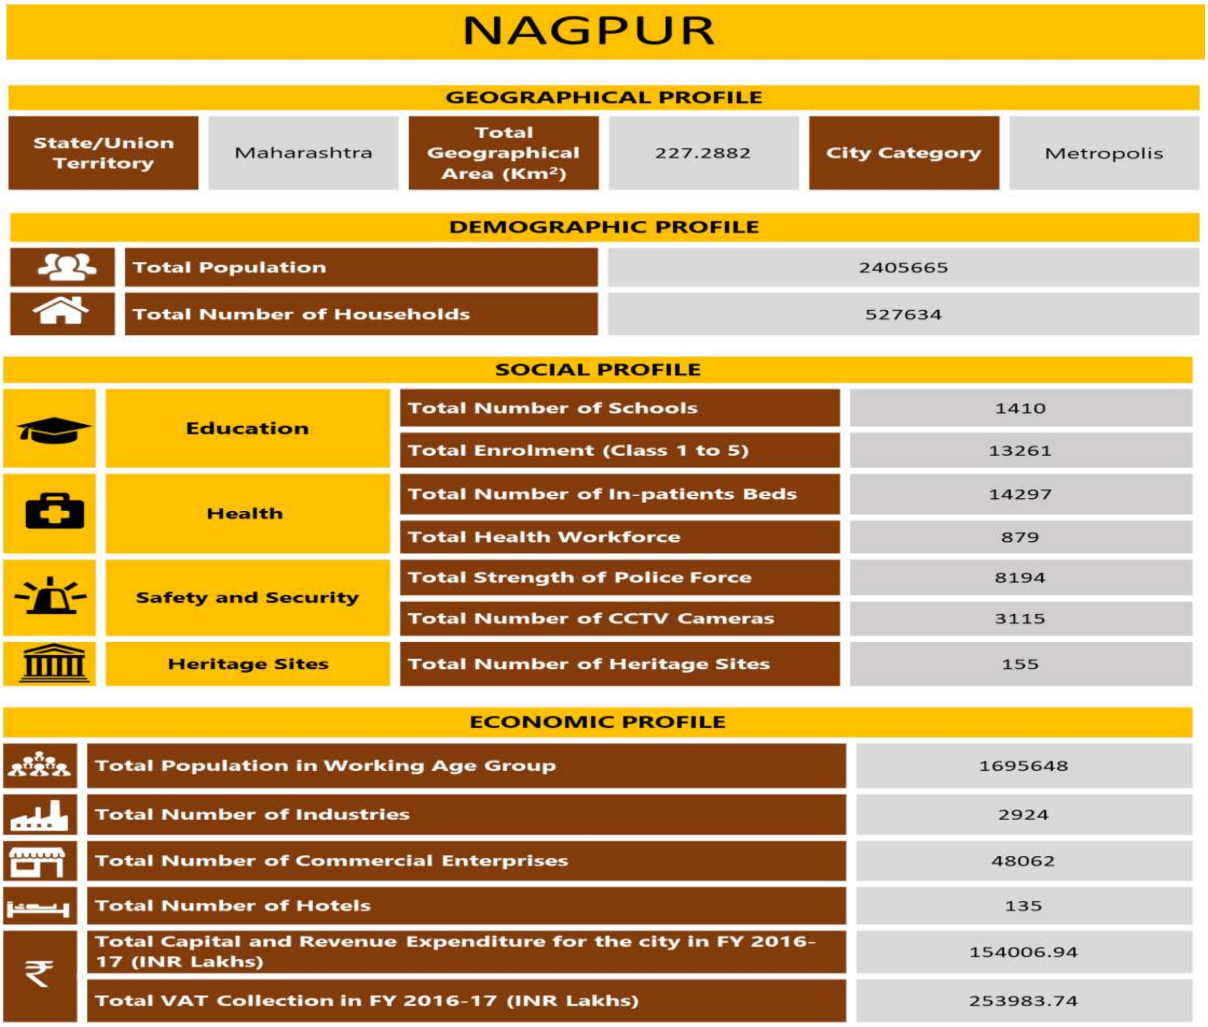
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



NAGPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	Total Geographical Area (Km²)	227.2882	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	2405665
Total Number of Households	527634

SOCIAL PROFILE

Education	Total Number of Schools	1410
	Total Enrolment (Class 1 to 5)	13261
Health	Total Number of In-patients Beds	14297
	Total Health Workforce	879
Safety and Security	Total Strength of Police Force	8194
	Total Number of CCTV Cameras	3115
Heritage Sites	Total Number of Heritage Sites	155

ECONOMIC PROFILE

Total Population in Working Age Group	1695648
Total Number of Industries	2924
Total Number of Commercial Enterprises	48062
Total Number of Hotels	135
₹ Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	154006.94
Total VAT Collection in FY 2016-17 (INR Lakhs)	253983.74

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	685.83
		Total Number of Water Connections	336686
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	523122
		Total number of households in the city with access to community toilets in the city	4512
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	1200
		Total number of households covered through door-to-door collection of solid waste	527634
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	400
		Daily average quantum of waste water treated by STPs in the city (MLD)	210
	Electricity	**Total number of authorized electrical connections in the city**	672033
		Total electricity supplied to the city (kWh)	1765769233
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	70250900
	Roads and Transport	**Total Length of Road Network in the City (Km)**	2794.53
		Total length of arterial and sub-arterial road network in the city (Km)	192.1
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	431.16

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places

Pillars of Comprehensive Development	Category	Indicators
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization

Pillars of Comprehensive Development	Category	Indicators
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account and Finance Department
Urban Local Body	For Park and Recreation Related Questions	Garden Department.
Urban Local Body	For Water Supply and Drainage related questions	Water Works Department
Urban Local Body	For Heritage sites related data	Estate Department
Urban Local Body	For Ecological sites related data	Town Planning Department
Urban Local Body	For Housing related data	Slum Department
Urban Local Body	For Building plan related data	General Administration Department

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Roads related data	Public Work Department (City Engineer & Development Engineer).
Urban Local Body	For Solid waste management related data	Health Department (Sanitation)
Urban Local Body	For IT services related data	E-Governance Department
Urban Local Body	For Vendor committee related data	Market Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Garden Department, Election Department, Education Department, Zilla Udyog Bhawan, Nagpur Residential Hotel Association,
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Maharashtra Pollution Central Board.
Development Authority	Building Infrastructure	Town Planning Department Nagpur Municipal Corporation.
	Construction planning	Town Planning Department Nagpur Municipal Corporation.
	Green Building	Data Unavailable
	Rain water harvesting	Town Planning Department Nagpur Municipal Corporation.
	Universal Design Principle	Town Planning Department Nagpur Municipal Corporation.
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	MahaVitran / DISCOM
State Disaster management authority		Fire Brigade Department Nagpur Municipal Corporation
State Education Department		Zilla Parishad Nagpur
State Health Department	Health care professionals	Nagpur Deputy Director Health Services.
	Citizen Services	Nagpur Deputy Director Health Services.
	Disease Prevalence	Nagpur Deputy Director Health Services.
	Health Infrastructure	Nagpur Deputy Director Health Services.
State Renewable Energy Development Agency		Maharashtra Energy Development Agency
State Sales / Commercial Taxes Department		Sales Tax Department Nagpur

Designated data owners	Subcategories	Data owners at city level
Town and Country Planning Department	Land Use	Town Planning Department Nagpur Municipal Corporation.
Traffic and Police Department		Traffic Police Department Nagpur
Transport Authorities	Buses	Transport Departmental
	Registered Vehicles	Deputy RTO Nagpur
	Sub urban rail transport	Central Railway / South East central Railway Nagpur.
	Mono Rail Authority	_
	Tramways	_
	Marine Transport Authority	_

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 59 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

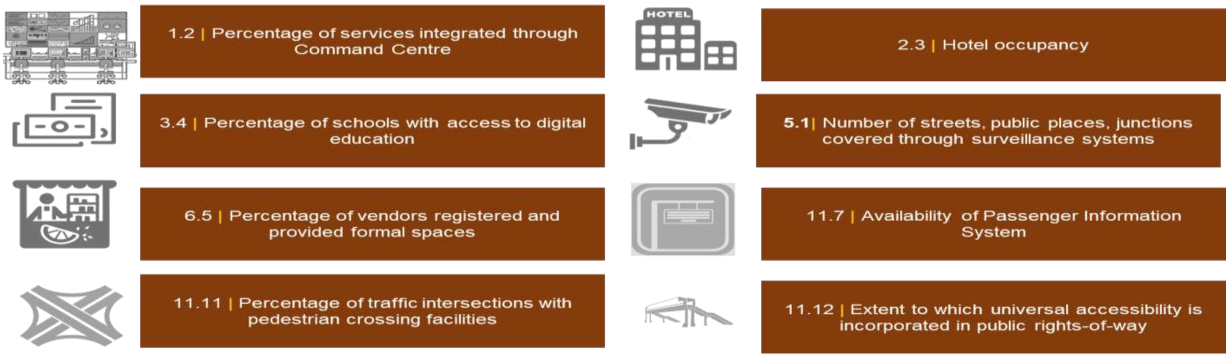
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	2
Traffic and Police Department	1
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	4
Town and Country Planning	2
State Health Department	1
Transport Authority	4
Disaster Management	1
Urban Local Body	40
Total	59*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

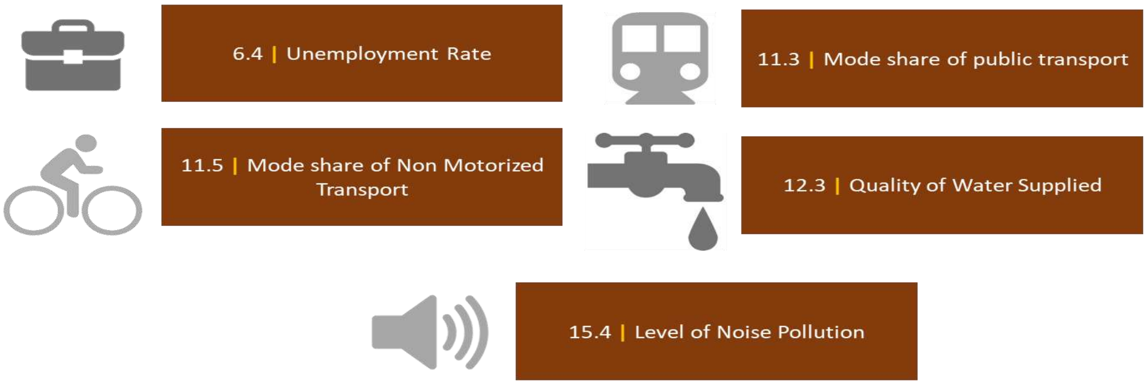
6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5 City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	43.28%
Identity & Culture	18%
Education	44%
Health	89%
Safety & Security	67%
Economy & Employment	16%
Housing & Inclusiveness	0%
Public Open Spaces	51%
Mixed Land Use & Compactness	17%

Categories	Scores in Percentage
Power Supply	51%
Transport & Mobility	46%
Assured Water Supply	81%
Waste Water Management	70%
Solid Waste Management	74%
Reduced Pollution	81%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Exécutive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the

CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP

#	Challenges	Proposed Solutions
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

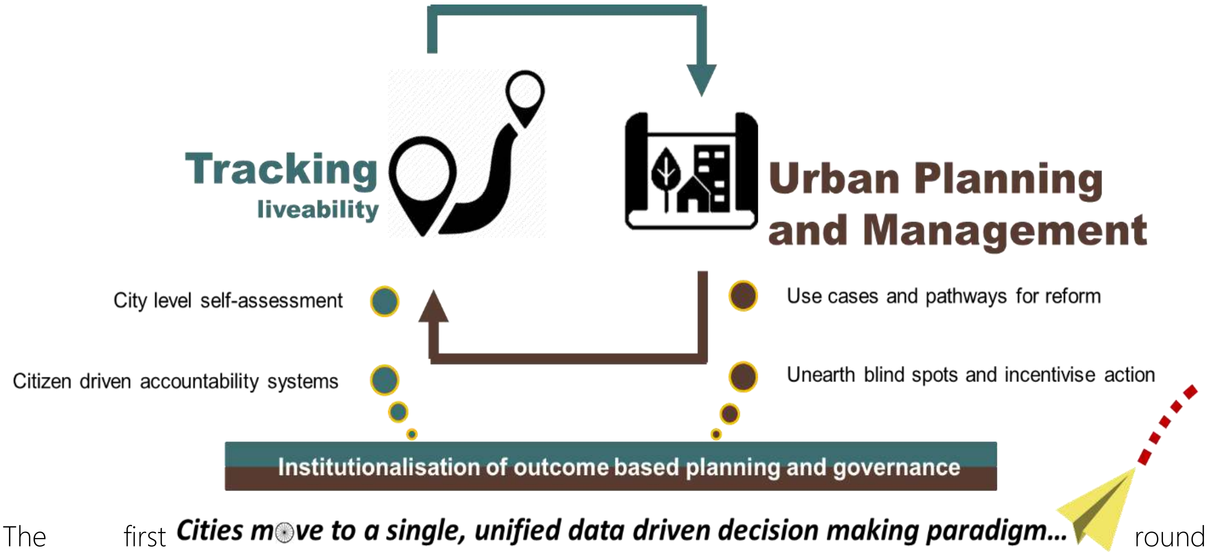
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



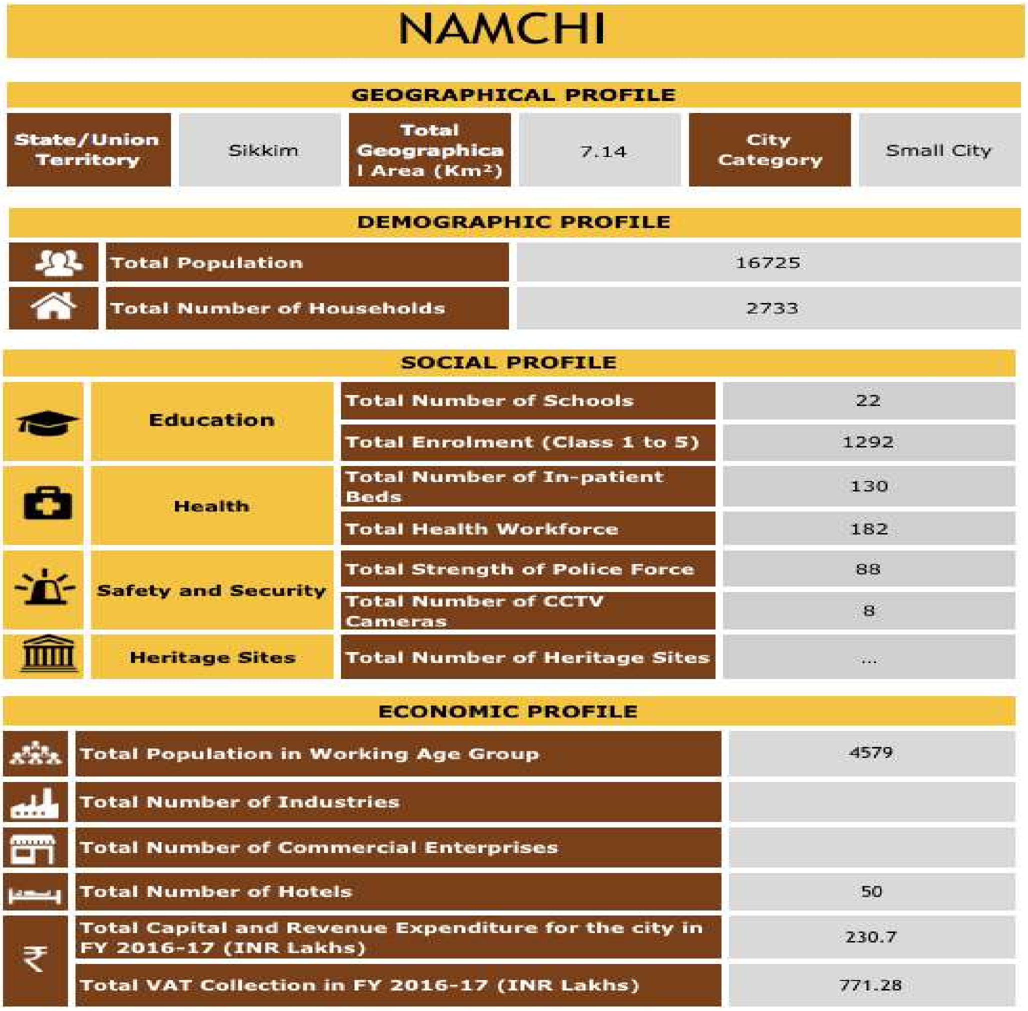
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of

the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



NAMCHI

GEOGRAPHICAL PROFILE

State/Union Territory	Sikkim	**Total Geographical Area (Km²)**	7.14	**City Category**	Small City

DEMOGRAPHIC PROFILE

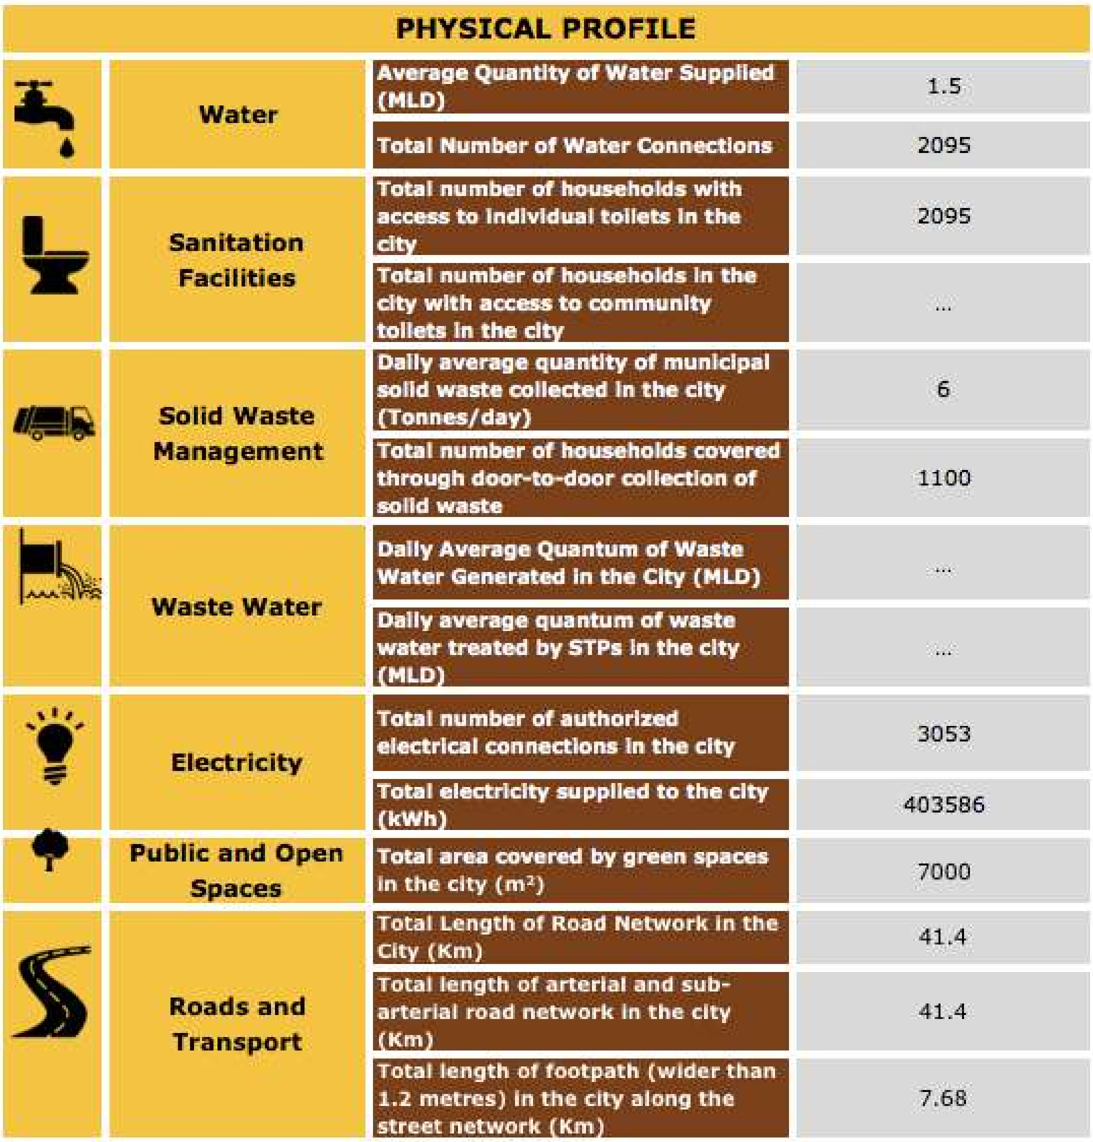
Total Population	16725
Total Number of Households	2733

SOCIAL PROFILE

Education	**Total Number of Schools**	22
	Total Enrolment (Class 1 to 5)	1292
Health	**Total Number of In-patient Beds**	130
	Total Health Workforce	182
Safety and Security	**Total Strength of Police Force**	88
	Total Number of CCTV Cameras	8
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	4579
Total Number of Industries	
Total Number of Commercial Enterprises	
Total Number of Hotels	50
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	230.7
Total VAT Collection in FY 2016-17 (INR Lakhs)	771.28



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	1.5
	Total Number of Water Connections	2095
Sanitation Facilities	Total number of households with access to individual toilets in the city	2095
	Total number of households in the city with access to community toilets in the city	...
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	6
	Total number of households covered through door-to-door collection of solid waste	1100
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	3053
	Total electricity supplied to the city (kWh)	403586
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	7000
Roads and Transport	Total Length of Road Network in the City (Km)	41.4
	Total length of arterial and sub-arterial road network in the city (Km)	41.4
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	7.68

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities

Pillars of Comprehensive Development	Category	Indicators
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population

Pillars of Comprehensive Development	Category	Indicators
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year

Pillars of Comprehensive Development	Category	Indicators
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities

Pillars of Comprehensive Development	Category	Indicators
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pol-	15.1 Concentration of SO_2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	lution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	**25 marks**	**5 marks**	**45 marks**
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal council Namchi
Urban Local Body	For Park and Recreation Related Questions	UD&HD (urban development and housing department)
Urban Local Body	For Water Supply and Drainage related questions	PHED (water security and public health engineering department)
Urban Local Body	For Heritage sites related data	Municipal council Namchi
Urban Local Body	For Ecological sites related data	Municipal council Namchi
Urban Local Body	For Housing related data	UD&HD (urban development and housing department)
Urban Local Body	For Building plan related data	UD&HD (urban development and housing department)
Urban Local Body	For Roads related data	UD&HD (urban development and housing department)
Urban Local Body	For Solid waste management related data	Municipal council namchi
Urban Local Body	For IT services related data	Municipal council namchi
Urban Local Body	For Vendor committee related data	Municipal council namchi
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Municipal council namchi
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State pollution control board Gangtok
Development Authority	Building Infrastructure	UD&HD (urban development and housing department)
	Construction planning	UD&HD (urban development and housing department)
	Green Building	UD&HD (urban development and housing department)

	Rain water harvesting	UD&HD (urban development and housing department)
	Universal Design Principle	UD&HD (urban development and housing department)
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Energy and power department namchi
State Disaster management authority		District collector office namchi
State Education Department		HRDD(human resource and development department) south
State Health Department	Health care professionals	Healthcare, human services and family welfare department namchi
	Citizen Services	Healthcare, human services and family welfare department namchi
	Disease Prevalence	Healthcare, human services and family welfare department namchi
	Health Infrastructure	Healthcare, human services and family welfare department namchi
State Renewable Energy Development Agency		SREDA GANGTOK
State Sales / Commercial Taxes Department		Sales and commercial tax Department Gangtok
Town and Country Planning Department	Land Use	UD&HD (urban development and housing department)
Traffic and Police Department		SNT (sikkim nationalised transport department) south
Transport Authorities	Buses	SNT (sikkim nationalised transport department) south
	Registered Vehicles	Motor vechile department south
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 7 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	1
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	0
Transport Authority	0
Disaster Management	0
Urban Local Body	6
Total	7

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators

(Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	30.02%
Identity & Culture	29%
Education	86%
Health	97%
Safety & Security	69%
Economy & Employment	45%
Housing & Inclusiveness	2%
Public Open Spaces	3%
Mixed Land Use & Compactness	0%
Power Supply	48%
Transport & Mobility	34%
Assured Water Supply	65%
Waste Water Management	35%
Solid Waste Management	53%
Reduced Pollution	60%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

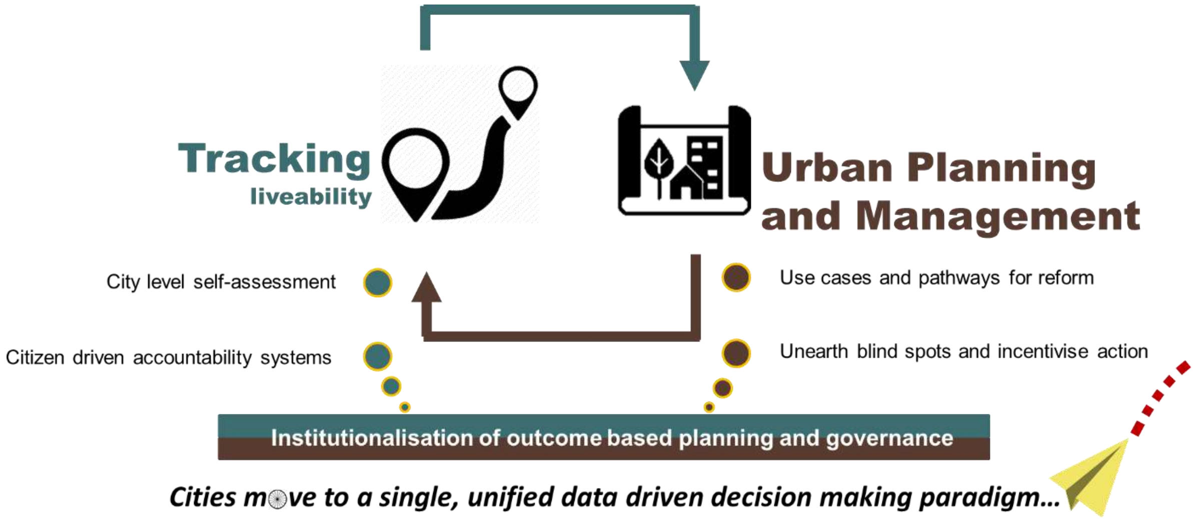
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

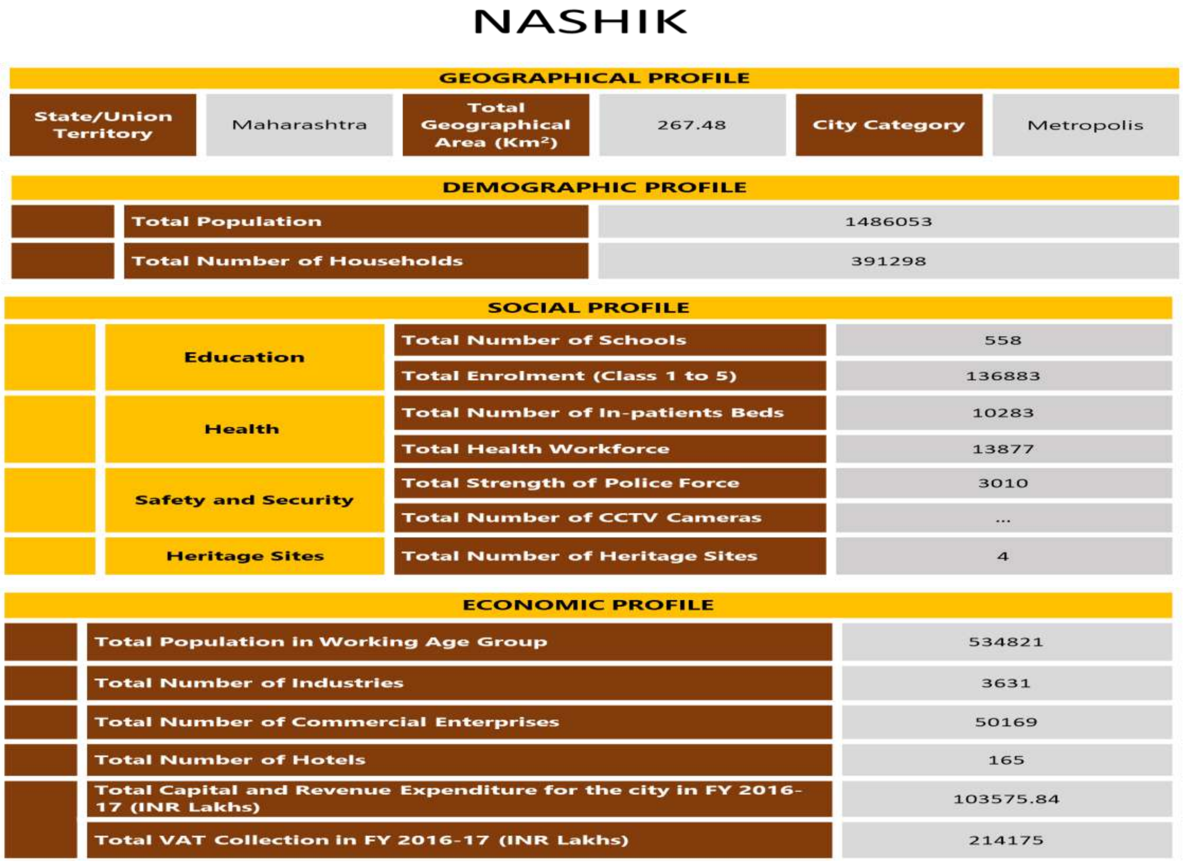
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



NASHIK

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	Total Geographical Area (Km^2)	267.48	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1486053
Total Number of Households	391298

SOCIAL PROFILE

Education	Total Number of Schools	558
	Total Enrolment (Class 1 to 5)	136883
Health	Total Number of In-patients Beds	10283
	Total Health Workforce	13877
Safety and Security	Total Strength of Police Force	3010
	Total Number of CCTV Cameras	...
Heritage Sites	Total Number of Heritage Sites	4

ECONOMIC PROFILE

Total Population in Working Age Group	534821
Total Number of Industries	3631
Total Number of Commercial Enterprises	50169
Total Number of Hotels	165
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	103575.84
Total VAT Collection in FY 2016-17 (INR Lakhs)	214175

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	410
		Total Number of Water Connections	193516
	Sanitation Facilities	Total number of households with access to individual toilets in the city	339018
		Total number of households in the city with access to community toilets in the city	38950
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	501
		Total number of households covered through door-to-door collection of solid waste	339018
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	288
		Daily average quantum of waste water treated by STPs in the city (MLD)	270
	Electricity	Total number of authorized electrical connections in the city	543289
		Total electricity supplied to the city (kWh)	1519800
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	7865100
	Roads and Transport	Total Length of Road Network in the City (Km)	1901
		Total length of arterial and sub-arterial road network in the city (Km)	120
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	65.6

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

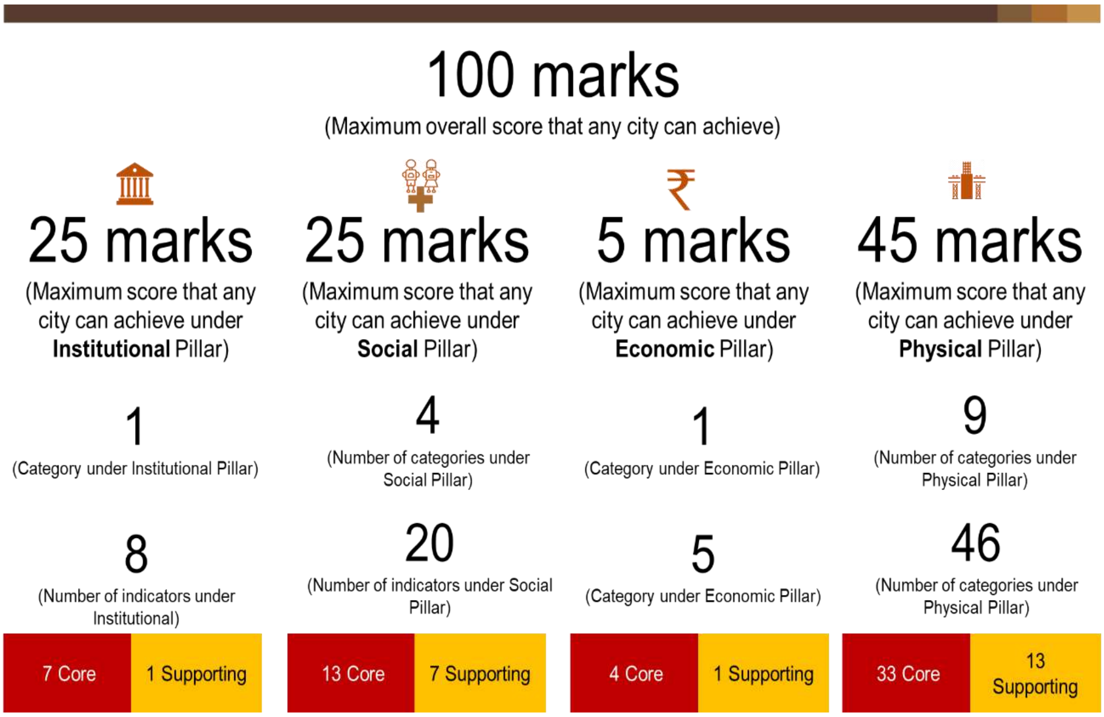
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, Nashik Municipal Corporation Excise Department
Urban Local Body	For Park and Recreation Related Questions	Town Planning, NMC District Collectorate office, NMC
Urban Local Body	For Water Supply and Drainage related questions	Maharashtra Industrial development Corporation, Nashik Public work department, Nashik Irrigation Department, Nashik
Urban Local Body	For Heritage sites related data	Tourism department
Urban Local Body	For Ecological sites related data	NMC
Urban Local Body	For Housing related data	Maharashtra Housing Development Corporation, Slum Department, NMC
Urban Local Body	For Building plan related data	Town Planning, NMC
Urban Local Body	For Roads related data	Town Planning, NMC
Urban Local Body	For Solid waste management related data	Waste Management Department, NMC
Urban Local Body	For IT services related data	IT Department, NMC
Urban Local Body	For Vendor committee related data	Nashik Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Maharashtra Pollution Control Board
Development Authority	Building Infrastructure	Town Planning, NMC
	Construction planning	Town Planning, NMC
	Green Building	Town Planning, NMC

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	Town Planning, NMC
	Universal Design Principle	Town Planning, NMC
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	DISCOM, Nashik Maharashtra State Electricity Development Corporation
State Disaster management authority		Fire fight and disaster management unit, NMC
State Education Department		District Education Department Education Department, NMC
State Health Department	Health care professionals	Civil Hospital, Nashik
	Citizen Services	Civil Hospital, Nashik
	Disease Prevalence	Civil Hospital, Nashik
	Health Infrastructure	Civil Hospital, Nashik Road and Transport Department
State Renewable Energy Development Agency		Maharashtra Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales Taxes department, Nashik
Town and Country Planning Department	Land Use	Town Planning, NMC
Traffic and Police Department		Commissioner of Police, Nashik
Transport Authorities	Buses	Road and Transport Office
	Registered Vehicles	Maharashtra State Transport department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 83 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**1**
DISCOM/Electricity Department	**2**
Traffic and Police Department	**5**
Development Authority	**0**
Pollution Control Board	**5**
State Renewable Energy Department	**1**
Town and Country Planning	**0**
State Health Department	**4**
Transport Authority	**2**
Disaster Management	**1**
Urban Local Body	**62**
Total	**83***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	61.58%
Identity & Culture	40%
Education	86%
Health	92%
Safety & Security	65%
Economy & Employment	3%
Housing & Inclusiveness	16%
Public Open Spaces	23%
Mixed Land Use & Compactness	50%
Power Supply	60%
Transport & Mobility	30%
Assured Water Supply	63%
Waste Water Management	80%
Solid Waste Management	65%
Reduced Pollution	84%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

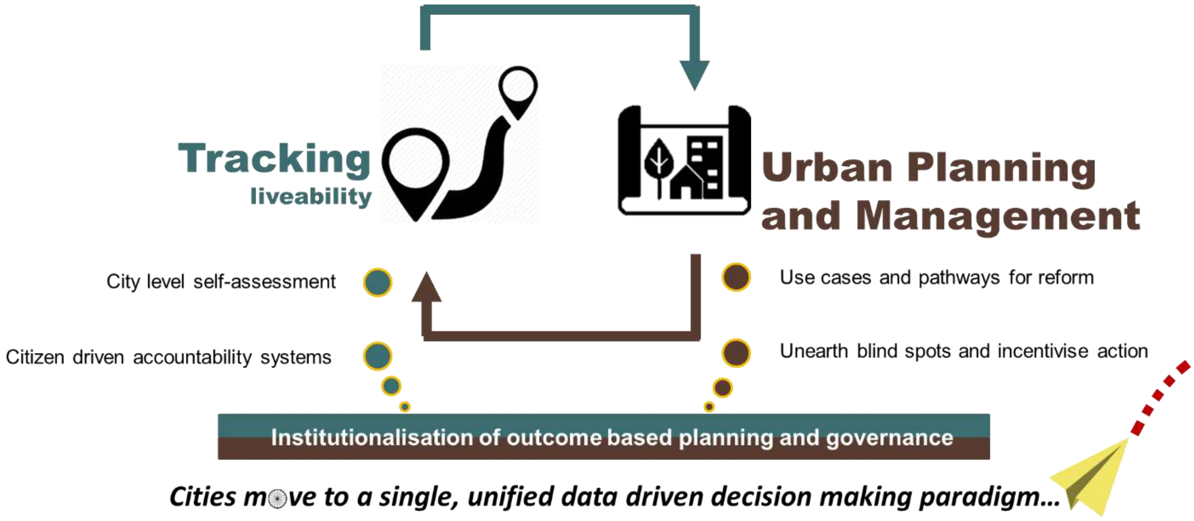
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

NAVI MUMBAI

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km^2)**	109.59	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1120547
Total Number of Households	273626

SOCIAL PROFILE

Education	**Total Number of Schools**	418
	Total Enrolment (Class 1 to 5)	118884
Health	**Total Number of In-patients Beds**	5836
	Total Health Workforce	3219
Safety and Security	**Total Strength of Police Force**	4654
	Total Number of CCTV Cameras	282
Heritage Sites	**Total Number of Heritage Sites**	...

Total Population in Working Age Group	1262534
Total Number of Industries	4815
Total Number of Commercial Enterprises	51661
Total Number of Hotels	48
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	107125.34
Total VAT Collection in FY 2016-17 (INR Lakhs)	290978.53

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	392
		Total Number of Water Connections	134025
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	228420
		Total number of households in the city with access to community toilets in the city	45006
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	707.6
		Total number of households covered through door-to-door collection of solid waste	273626
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	257.15
		Daily average quantum of waste water treated by STPs in the city (MLD)	205
	Electricity	**Total number of authorized electrical connections in the city**	473766
		Total electricity supplied to the city (kWh)	3239774000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	37616598
	Roads and Transport	**Total Length of Road Network in the City (Km)**	506.12
		Total length of arterial and sub-arterial road network in the city (Km)	52.97
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	423.69

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

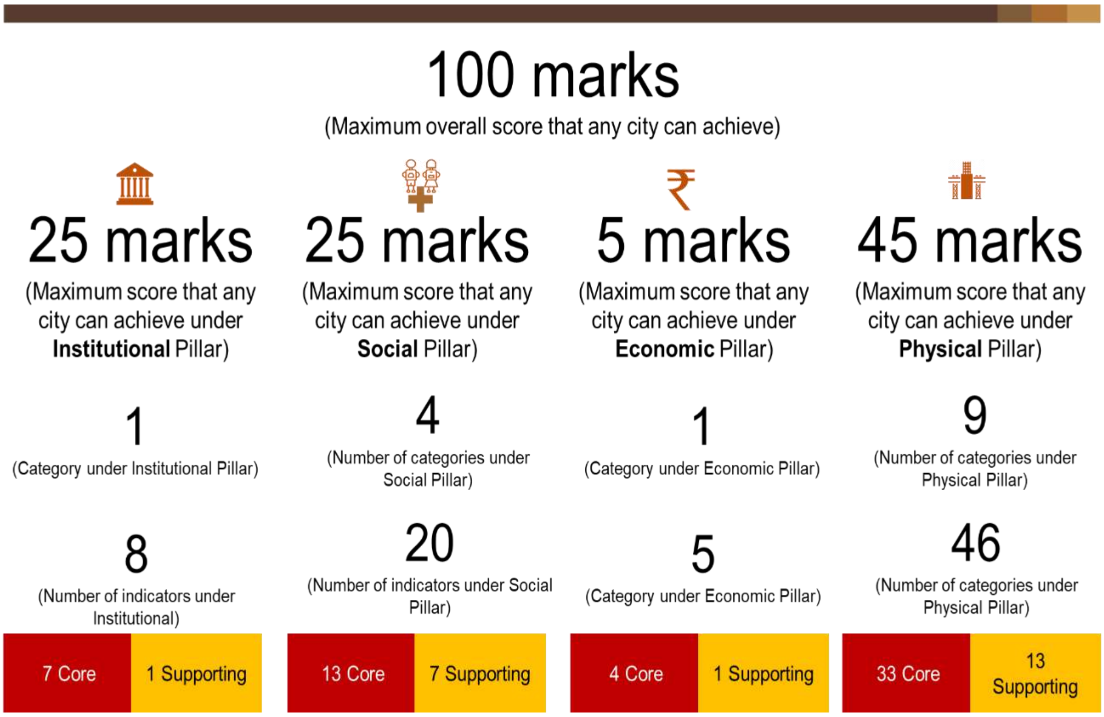
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Garden department
Urban Local Body	For Water Supply and Drainage	Water department

Designated data owners	Subcategories	Data owners at city level
	related questions	
Urban Local Body	For Heritage sites related data	License department
Urban Local Body	For Ecological sites related data	License department
Urban Local Body	For Housing related data	Town planning department
Urban Local Body	For Building plan related data	City engineer and town planning department
Urban Local Body	For Roads related data	City engineer department
Urban Local Body	For Solid waste management related data	Solid waste management department
Urban Local Body	For IT services related data	It department
Urban Local Body	For Vendor committee related data	License department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Water department and environment department
Development Authority	Building Infrastructure	City engineer and town planning department
	Construction planning	City engineer department
	Green Building	Town planning department
	Rain water harvesting	Town planning department
	Universal Design Principle	City engineering department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity department
State Disaster management authority		Disaster management department
State Education Department		Education department
State Health Department	Health care professionals	Health department
	Citizen Services	Health department
	Disease Prevalence	Health department
	Health Infrastructure	Health department
State Renewable Energy Development Agency		Town planning department
State Sales / Commercial Taxes Department		Accounts department
Town and Country Planning Department	Land Use	Town planning department
Traffic and Police Department		Disaster management department
Transport Authorities	Buses	Transport department

Designated data owners	Subcategories	Data owners at city level
	Registered Vehicles	Transport department
	Sub urban rail transport	Transport department
	Mono Rail Authority	Transport department
	Tramways	Transport department
	Marine Transport Authority	Transport department

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 318 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**4**
DISCOM/Electricity Department	**20**
Traffic and Police Department	**16**
Development Authority	**38**
Pollution Control Board	**6**
State Renewable Energy Department	**3**
Town and Country Planning	**3**
State Health Department	**26**
Transport Authority	**18**
Disaster Management	**2**
Urban Local Body	**180**
Total	**318***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	68.51%
Identity & Culture	50%
Education	96%
Health	99%
Safety & Security	98%
Economy & Employment	21%
Housing & Inclusiveness	11%
Public Open Spaces	50%
Mixed Land Use & Compactness	21%
Power Supply	46%
Transport & Mobility	65%
Assured Water Supply	82%
Waste Water Management	77%
Solid Waste Management	84%
Reduced Pollution	90%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.
An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.
For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed

and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.
The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.

#	Challenges	Proposed Solutions
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.

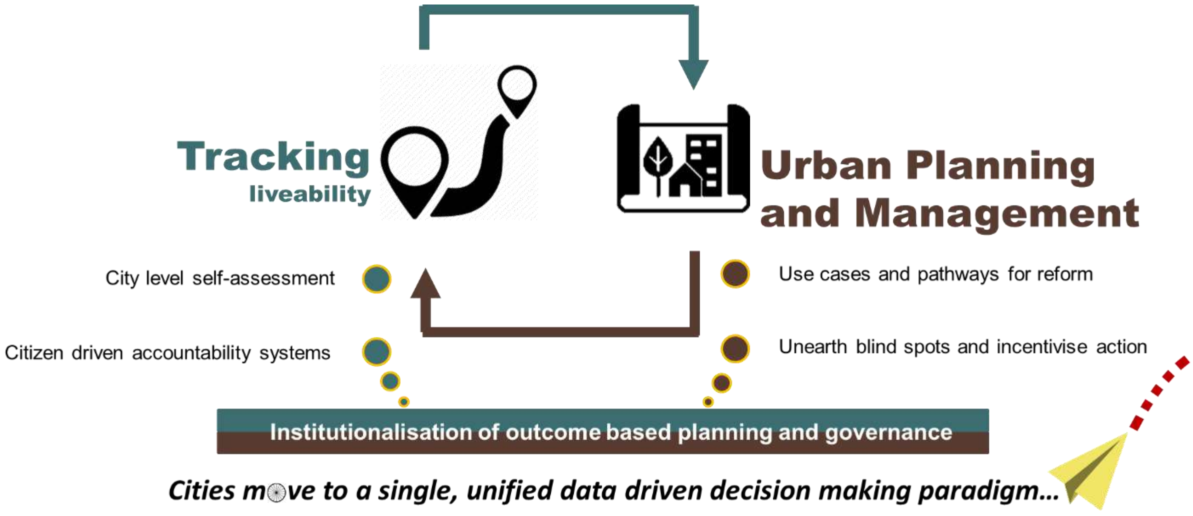
#	Challenges	Proposed Solutions
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

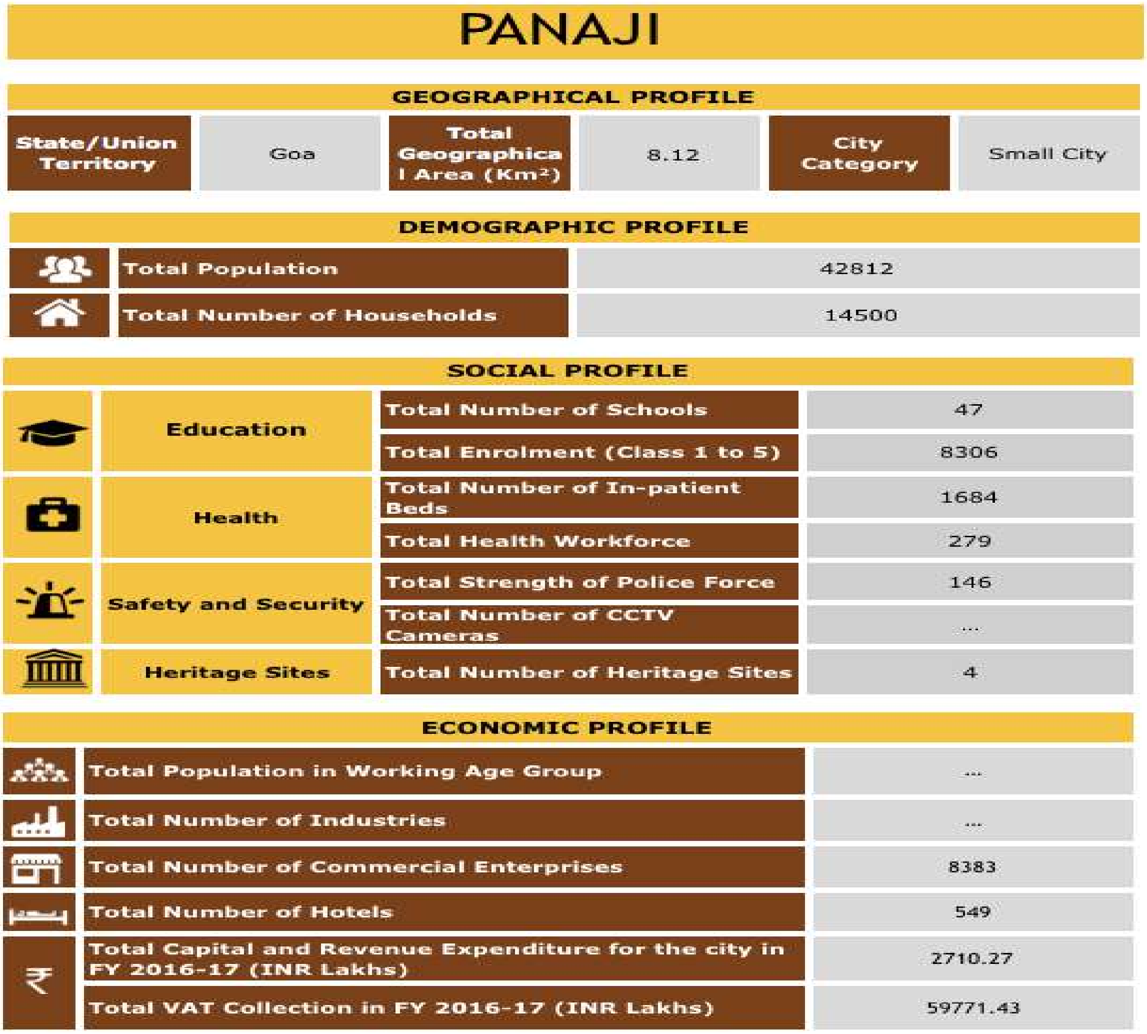


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



PANAJI

GEOGRAPHICAL PROFILE

State/Union Territory	Goa	Total Geographical Area (Km²)	8.12	City Category	Small City

DEMOGRAPHIC PROFILE

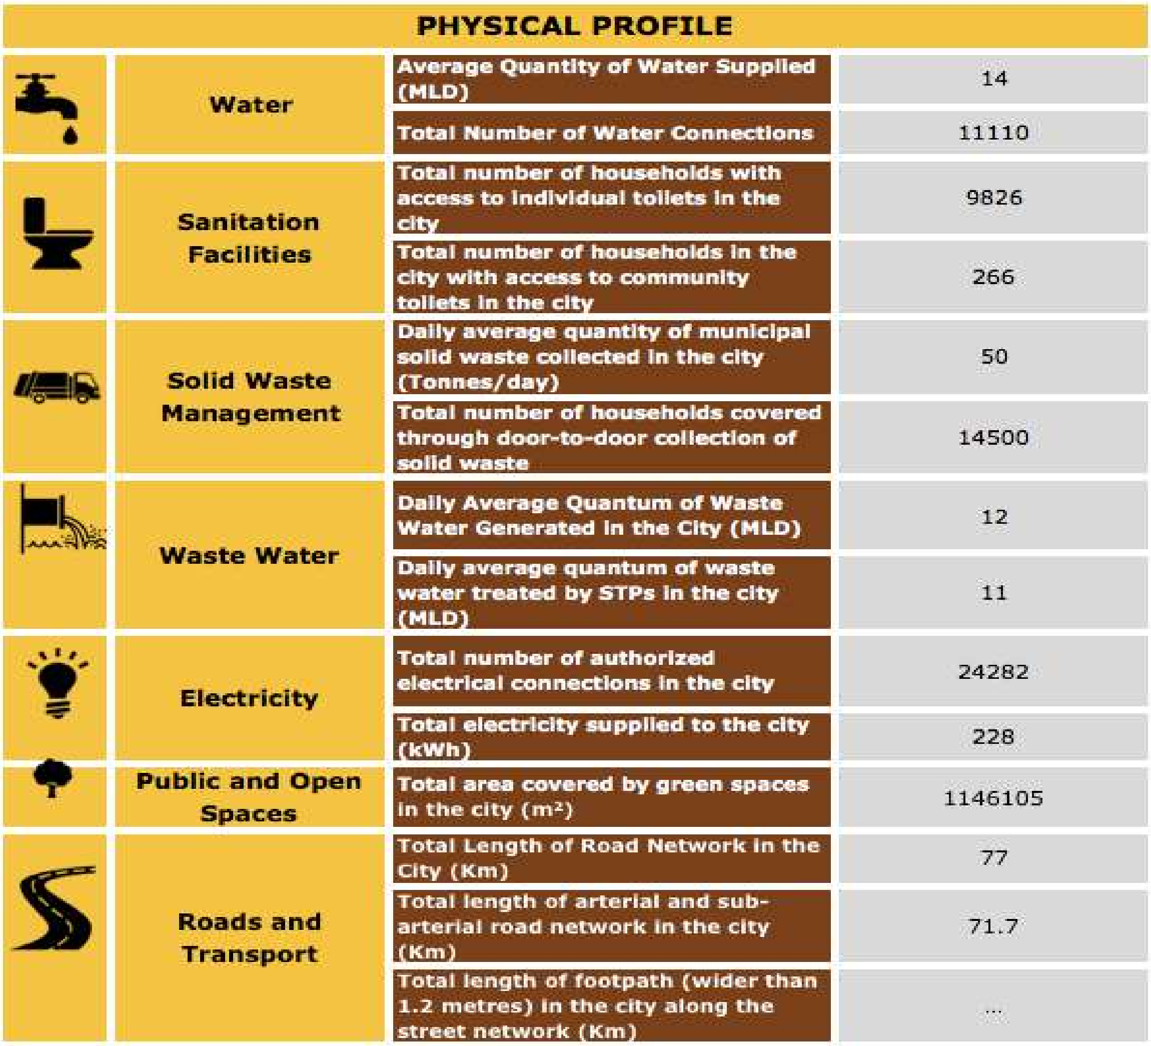
Total Population	42812
Total Number of Households	14500

SOCIAL PROFILE

Education	Total Number of Schools	47
	Total Enrolment (Class 1 to 5)	8306
Health	Total Number of In-patient Beds	1684
	Total Health Workforce	279
Safety and Security	Total Strength of Police Force	146
	Total Number of CCTV Cameras	...
Heritage Sites	Total Number of Heritage Sites	4

ECONOMIC PROFILE

Total Population in Working Age Group	...
Total Number of Industries	...
Total Number of Commercial Enterprises	8383
Total Number of Hotels	549
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	2710.27
Total VAT Collection in FY 2016-17 (INR Lakhs)	59771.43



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	14
	Total Number of Water Connections	11110
Sanitation Facilities	Total number of households with access to individual toilets in the city	9826
	Total number of households in the city with access to community toilets in the city	266
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	50
	Total number of households covered through door-to-door collection of solid waste	14500
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	12
	Daily average quantum of waste water treated by STPs in the city (MLD)	11
Electricity	Total number of authorized electrical connections in the city	24282
	Total electricity supplied to the city (kWh)	228
Public and Open Spaces	Total area covered by green spaces in the city (m²)	1146105
Roads and Transport	Total Length of Road Network in the City (Km)	77
	Total length of arterial and sub-arterial road network in the city (Km)	71.7
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	...

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive

development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places

Pillars of Comprehensive Development	Category	Indicators
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization

Pillars of Comprehensive Development	Category	Indicators
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollu-	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	tion	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core	13 Core	4 Core	33 Core
1 Supporting	7 Supporting	1 Supporting	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by

the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Corporation of City of Panaji
Urban Local Body	For Park and Recreation Related Questions	Corporation of City of Panaji
Urban Local Body	For Water Supply and Drainage related questions	Public Works Department
Urban Local Body	For Heritage sites related data	Urban Local Body
Urban Local Body	For Ecological sites related	North Goa Planning and Development Author-

Designated data owners	Subcategories	Data owners at city level
	data	ity
Urban Local Body	For Housing related data	Corporation of City of Panaji and North Goa Planning and Development Authority
Urban Local Body	For Building plan related data	Corporation of City of Panaji and North Goa Planning and Development Authority
Urban Local Body	For Roads related data	Transport Department
Urban Local Body	For Solid waste management related data	Corporation of City of Panaji
Urban Local Body	For IT services related data	Corporation of City of Panaji and Department of Information Technology
Urban Local Body	For Vendor committee related data	Corporation of City of Panaji
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Corporation of City of Panaji
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Goa Pollution Control Board
Development Authority	Building Infrastructure	Corporation of City of Panaji and North Goa Planning and Development Authority
	Construction planning	Corporation of City of Panaji
	Green Building	North Goa Planning and Development Authority
	Rain water harvesting	Water Resource Department
	Universal Design Principle	North Goa Planning and Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Department
State Disaster management authority		
State Education De-		

Designated data owners	Subcategories	Data owners at city level
partment		
State Health Department	Health care professionals	Directorate of Health Services, Panaji
	Citizen Services	Directorate of Health Services, Panaji
	Disease Prevalence	Directorate of Health Services, Panaji
	Health Infrastructure	Directorate of Health Services, Panaji
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		Office of the Commissioner of Commercial Taxes
Town and Country Planning Department	Land Use	Town and Country Planning Department and North Goa Planning and Development Authority
Traffic and Police Department		
Transport Authorities	Buses	Directorate of Transport
	Registered Vehicles	Directorate of Transport
	Sub urban rail transport	Directorate of Transport
	Mono Rail Authority	Directorate of Transport
	Tramways	Directorate of Transport
	Marine Transport Authority	River Navigation Department

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 30 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	3
DISCOM/Electricity Department	2
Traffic and Police Department	3
Development Authority	2
Pollution Control Board	1
State Renewable Energy Department	1
Town and Country Planning	0
State Health Department	1
Transport Authority	4
Disaster Management	0
Urban Local Body	13
Total	30

.

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	Scores in Percentage
Governance	52.22%
Identity & Culture	9%
Education	98%
Health	81%
Safety & Security	67%
Economy & Employment	33%
Housing & Inclusiveness	0%
Public Open Spaces	51%
Mixed Land Use & Compactness	0%
Power Supply	71%
Transport & Mobility	11%
Assured Water Supply	57%
Waste Water Management	55%
Solid Waste Management	68%
Reduced Pollution	64%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring

#	Challenges	Proposed Solutions
	of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

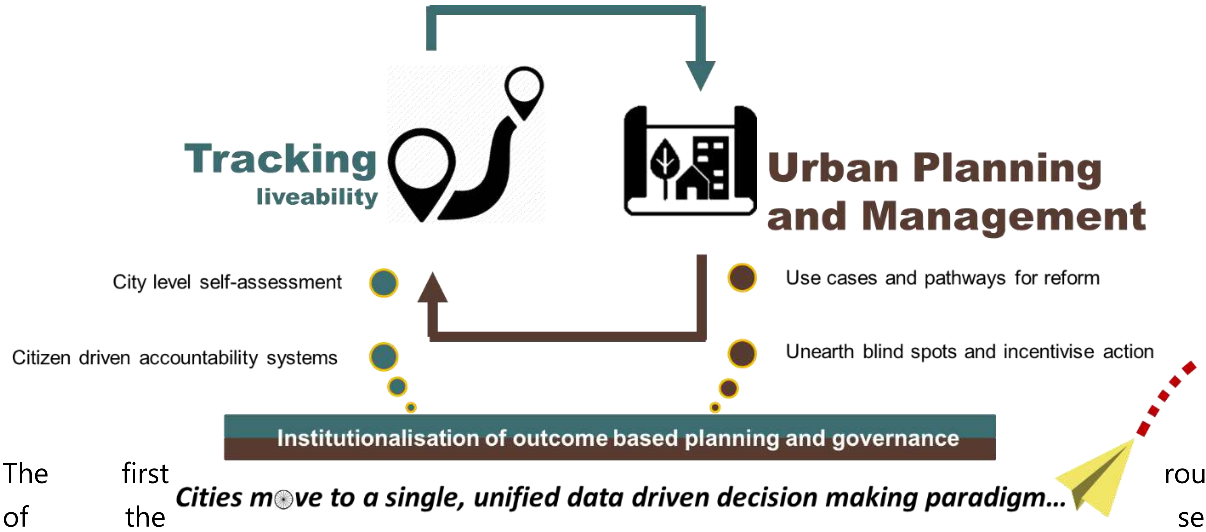
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more ‘liveable.’ The overarching goal of these initiatives is to move from an input-based approach to a ‘citizen centric-outcome based’ assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of ‘Liveability Standards’ relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an ‘Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city’s liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

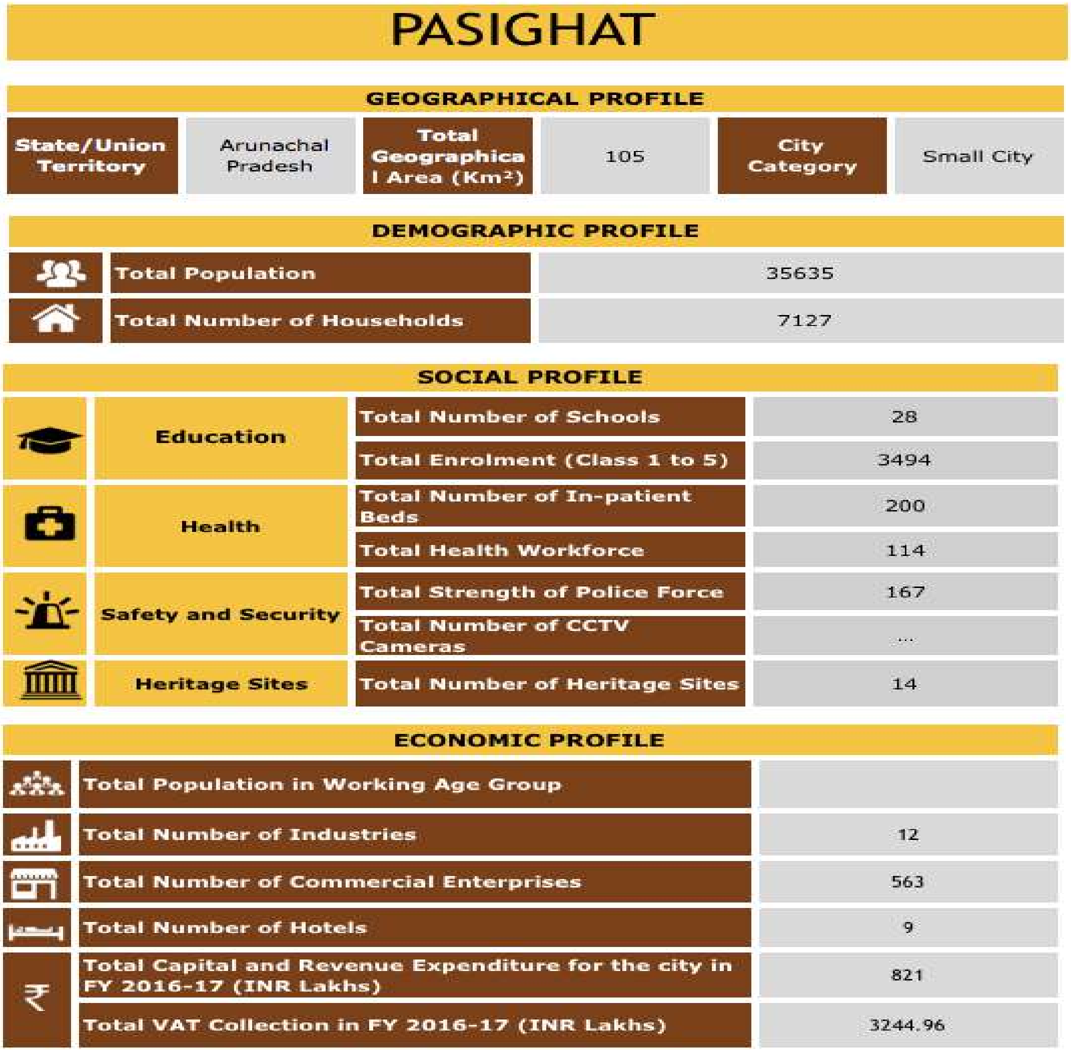


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the sessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



PASIGHAT

GEOGRAPHICAL PROFILE

State/Union Territory	Arunachal Pradesh	**Total Geographical Area (Km²)**	105	**City Category**	Small City

DEMOGRAPHIC PROFILE

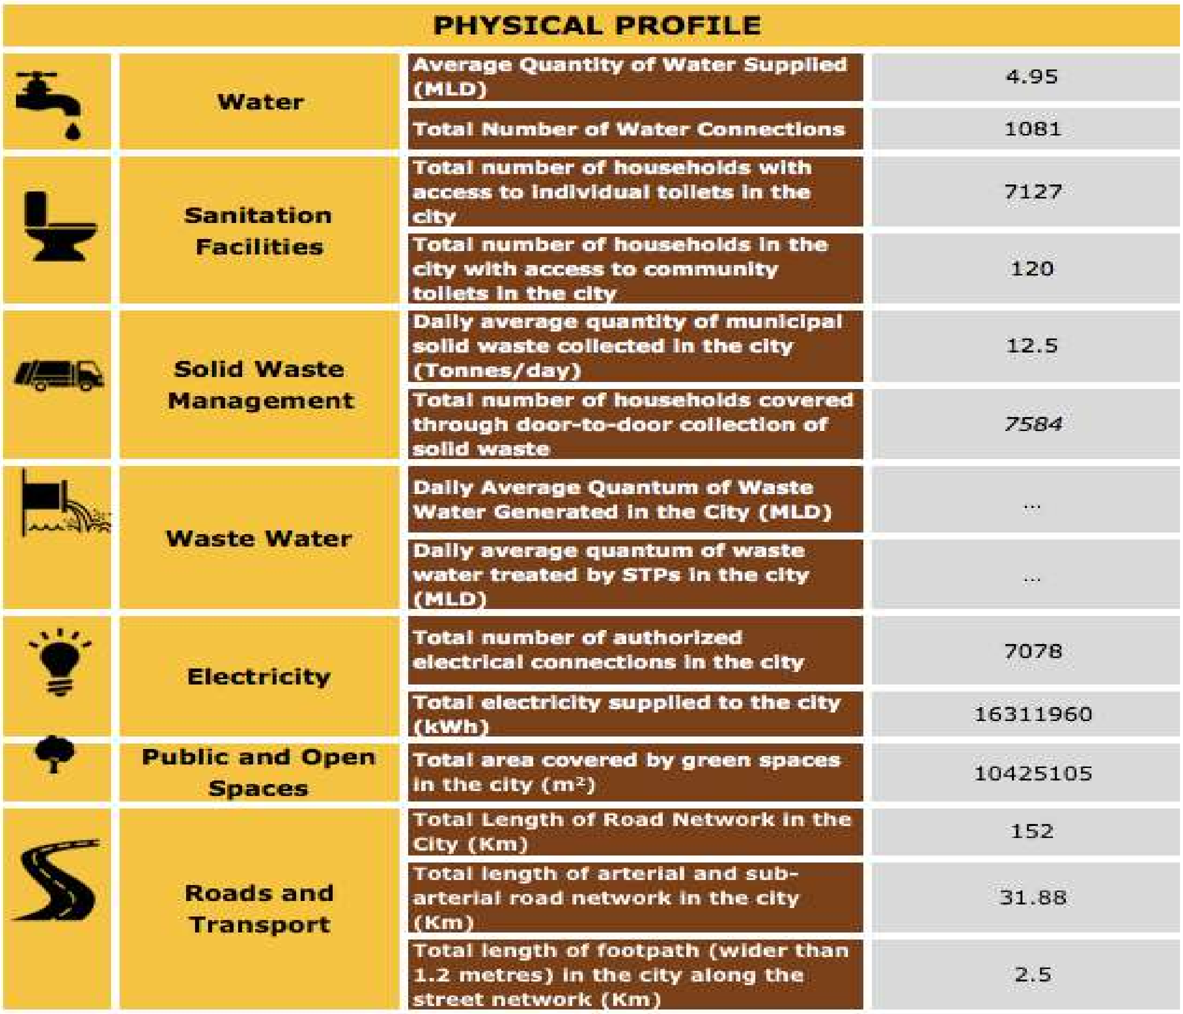
Total Population	35635
Total Number of Households	7127

SOCIAL PROFILE

Education	**Total Number of Schools**	28
	Total Enrolment (Class 1 to 5)	3494
Health	**Total Number of In-patient Beds**	200
	Total Health Workforce	114
Safety and Security	**Total Strength of Police Force**	167
	Total Number of CCTV Cameras	...
Heritage Sites	**Total Number of Heritage Sites**	14

ECONOMIC PROFILE

Total Population in Working Age Group	
Total Number of Industries	12
Total Number of Commercial Enterprises	563
Total Number of Hotels	9
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	821
Total VAT Collection in FY 2016-17 (INR Lakhs)	3244.96



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	4.95
	Total Number of Water Connections	1081
Sanitation Facilities	Total number of households with access to individual toilets in the city	7127
	Total number of households in the city with access to community toilets in the city	120
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	12.5
	Total number of households covered through door-to-door collection of solid waste	*7584*
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	7078
	Total electricity supplied to the city (kWh)	16311960
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	10425105
Roads and Transport	Total Length of Road Network in the City (Km)	152
	Total length of arterial and sub-arterial road network in the city (Km)	31.88
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2.5

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city

Pillars of Comprehensive Development	Category	Indicators
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year

Pillars of Comprehensive Development	Category	Indicators
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters

Pillars of Comprehensive Development	Category	Indicators
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization

Pillars of Comprehensive Development	Category	Indicators
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains

Pillars of Comprehensive Development	Category	Indicators
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

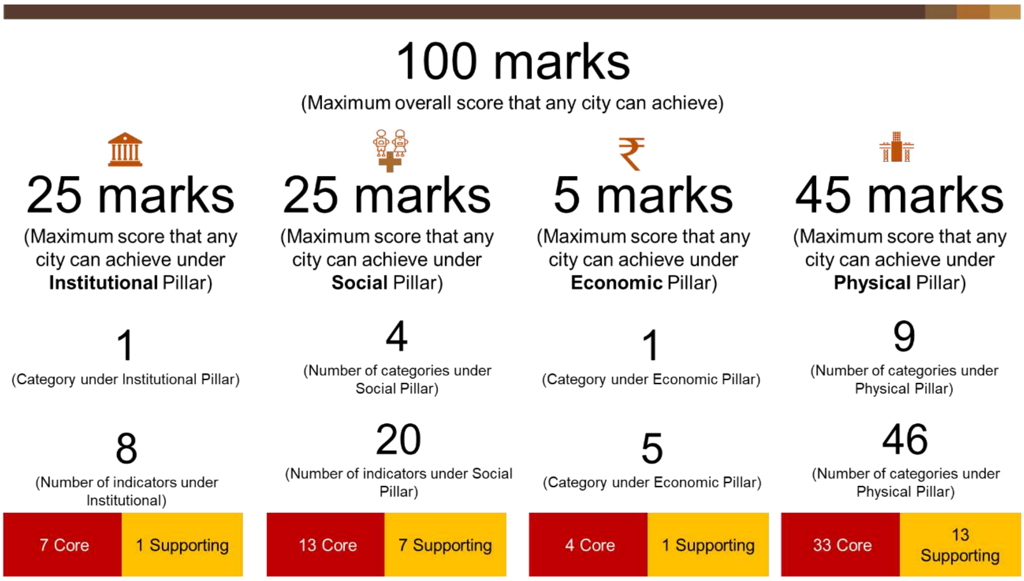
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Municipal department
Urban Local Body	For Park and Recreation Related Questions	Municipal department
Urban Local Body	For Water Supply and Drainage related questions	Water department
Urban Local Body	For Heritage sites related data	Municipal council
Urban Local Body	For Ecological sites related data	Municipal council and town planning department
Urban Local Body	For Housing related data	Town planning department
Urban Local Body	For Building plan related data	Town planning department
Urban Local Body	For Roads related data	District Transport department
Urban Local Body	For Solid waste management related data	Municipal council
Urban Local Body	For IT services related data	Municipal council
Urban Local Body	For Vendor committee related data	Municipal council and town planning g Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	No
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	
Development Authority	Building Infrastructure	Town planning department
	Construction planning	TownTown planning department
	Green Building	Town planning department
	Rain water harvesting	Town planning department
	Universal Design Principle	Town planning department

DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	By Electrical department
State Disaster management authority		Filled data by district disaster management officer itself
State Education Department		Collected data from Udice education department
State Health Department	Health care professionals	Collected data from office of general hospital pasighat.
	Citizen Services	Collected data by district medical officer.
	Disease Prevalence	This data has taken from the Ashamed diagnostic lab pasighat by the nodel officer
	Health Infrastructure	Collected data from all the hospitals of pasighat city.
State Renewable Energy Development Agency		Data feed by project officer of Arunachal Pradesh energy Development Agency who itself is the nodal officer .
State Sales / Commercial Taxes Department		All the datas were feed by superintendent of tax and exice Development.
Town and Country Planning Department	Land Use	Data feed by secretary Municipal council .
Traffic and Police Department		
Transport Authorities	Buses	datas were feed by district transport officer.
	Registered Vehicles	Datas were feed by district transport officer.
	Sub urban rail transport	Rail service is not available in the pasigha.Confirmation given by district transport officer.
	Mono Rail Authority	Rail service is not available in Pasighat.Confirmation given by district transport officer.

	Tramways	Service not available.Confirmation given by district transport officer.
	Marine Transport Authority	Service not available.Confirmation given by district transport officer.

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 0 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

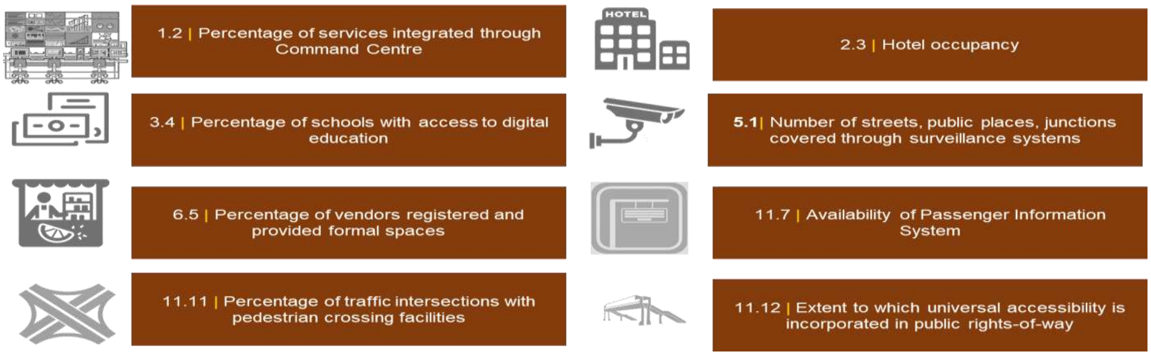
Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	0
Town and Country Planning	0

State Health Department	0
Transport Authority	0
Disaster Management	0
Urban Local Body	0
Total	0

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	Scores in Percentage
Governance	40.40%
Identity & Culture	17%
Education	82%
Health	97%
Safety & Security	58%
Economy & Employment	25%
Housing & Inclusiveness	8%
Public Open Spaces	61%
Mixed Land Use & Compactness	0%
Power Supply	41%
Transport & Mobility	32%
Assured Water Supply	24%
Waste Water Management	20%
Solid Waste Management	63%
Reduced Pollution	5%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

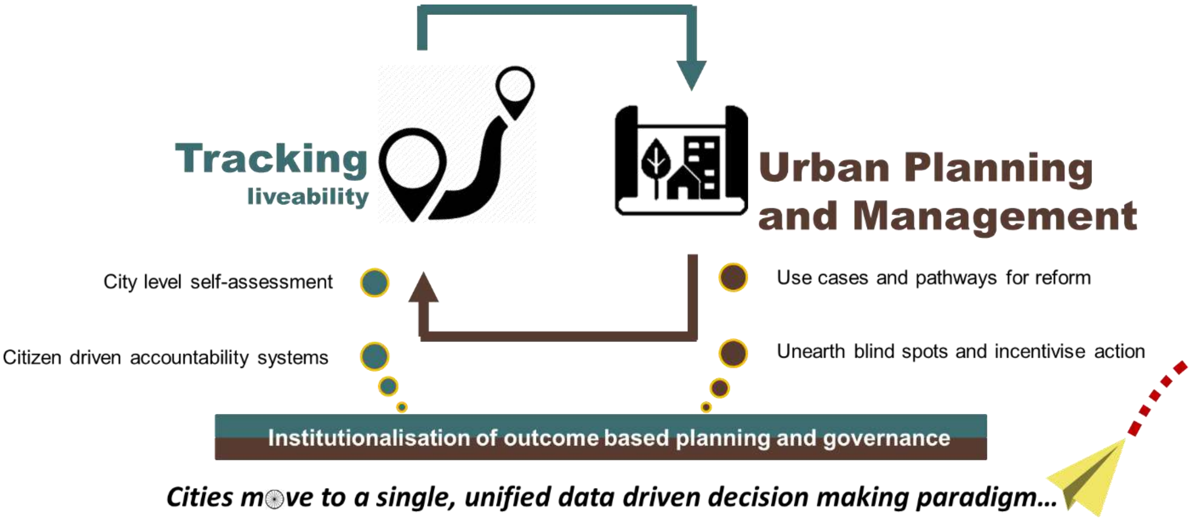
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PATNA

GEOGRAPHICAL PROFILE

State/Union Territory	Bihar	**Total Geographical Area (Km^2)**	109.218	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1852644
Total Number of Households	328296

SOCIAL PROFILE

Education	**Total Number of Schools**	501
	Total Enrolment (Class 1 to 5)	63523
Health	**Total Number of In-patient Beds**	10182
	Total Health Workforce	3560
Safety and Security	**Total Strength of Police Force**	11190
	Total Number of CCTV Cameras	412
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	
Total Number of Industries	139
Total Number of Commercial Enterprises	216
Total Number of Hotels	59
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	29353.55
Total VAT Collection in FY 2016-17 (INR Lakhs)	...

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	132
	Total Number of Water Connections	179695
Sanitation Facilities	Total number of households with access to individual toilets in the city	205814
	Total number of households in the city with access to community toilets in the city	1275
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	754
	Total number of households covered through door-to-door collection of solid waste	94016
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	224.6
	Daily average quantum of waste water treated by STPs in the city (MLD)	121
Electricity	Total number of authorized electrical connections in the city	433805
	Total electricity supplied to the city (kWh)	225143.19
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1660000
Roads and Transport	Total Length of Road Network in the City (Km)	2516
	Total length of arterial and sub-arterial road network in the city (Km)	53
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	26

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

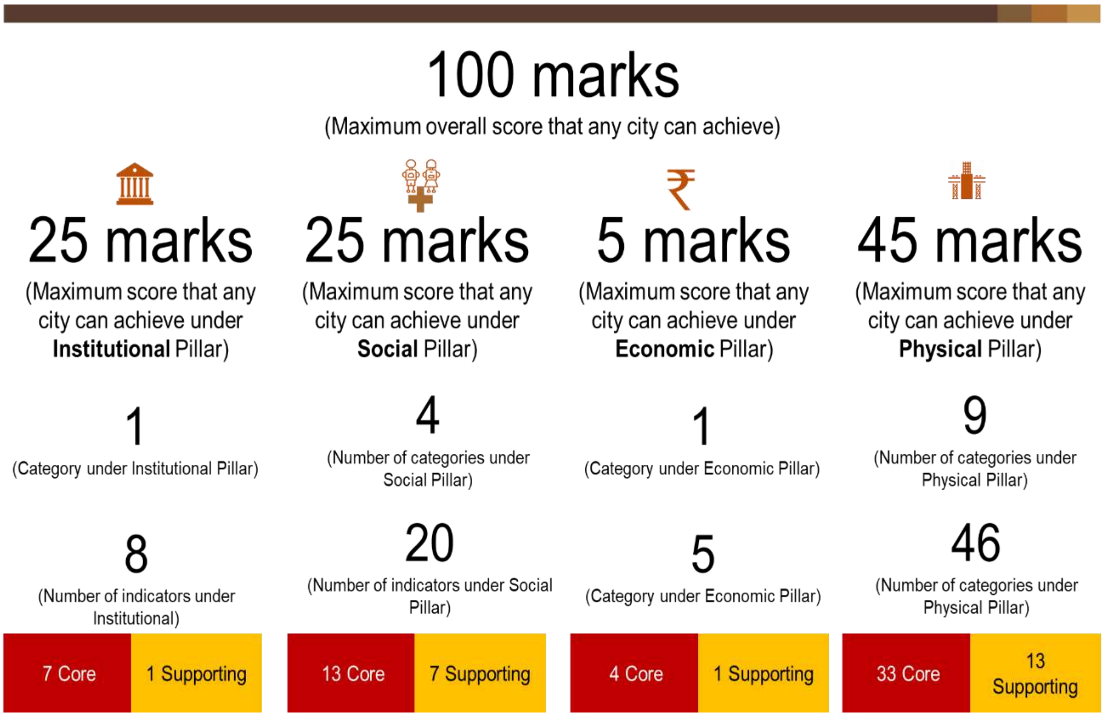
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department, Patna Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Department, Patna Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Patna Municipal Corporation
Urban Local Body	For Heritage sites related data	Patna Municipal Corporation
Urban Local Body	For Ecological sites related data	Patna Municipal Corporation
Urban Local Body	For Housing related data	Social development Section, Patna Municipal Corporation
Urban Local Body	For Building plan related data	Engineering Department, Patna Municipal Corporation
Urban Local Body	For Roads related data	Engineering Department, Patna Municipal Corporation
Urban Local Body	For Solid waste management related data	Patna Municipal Corporation
Urban Local Body	For IT services related data	IT section, Patna Municipal corporation
Urban Local Body	For Vendor committee related data	Social Development Section, Patna Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board, Bihar

Designated data owners	Subcategories	Data owners at city level
Development Authority	Building Infrastructure	Engineering Department, Patna Municipal Corporation
	Construction planning	Engineering Department, Patna Municipal Corporation
	Green Building	Engineering Department, Patna Municipal Corporation
	Rain water harvesting	Engineering Department, Patna Municipal Corporation
	Universal Design Principle	Engineering Department, Patna Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Bihar Power Distribution Corporation Limited
State Disaster management authority		District Collectorate Office
State Education Department		District Education Department
State Health Department	Health care professionals	Civil Surgeon Office
	Citizen Services	Civil Surgeon Office
	Disease Prevalence	State Health Mission
	Health Infrastructure	Civil Surgeon Office
State Renewable Energy Development Agency		Bihar Renewable Energy Development Authority
State Sales / Commercial Taxes Department		State Commercial and Tax department
Town and Country Planning Department	Land Use	Patna Municipal Corporation
Traffic and Police Department		Office of Senior Superintendent of Police
Transport Authorities	Buses	State Transport Authority, District Transport office
	Registered Vehicles	State Transport Authority, District Transport office
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 4 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	3

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	31.82%
Identity & Culture	26%
Education	43%
Health	85%
Safety & Security	63%
Economy & Employment	2%
Housing & Inclusiveness	9%
Public Open Spaces	5%
Mixed Land Use & Compactness	50%
Power Supply	56%
Transport & Mobility	37%
Assured Water Supply	43%
Waste Water Management	42%
Solid Waste Management	41%
Reduced Pollution	47%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

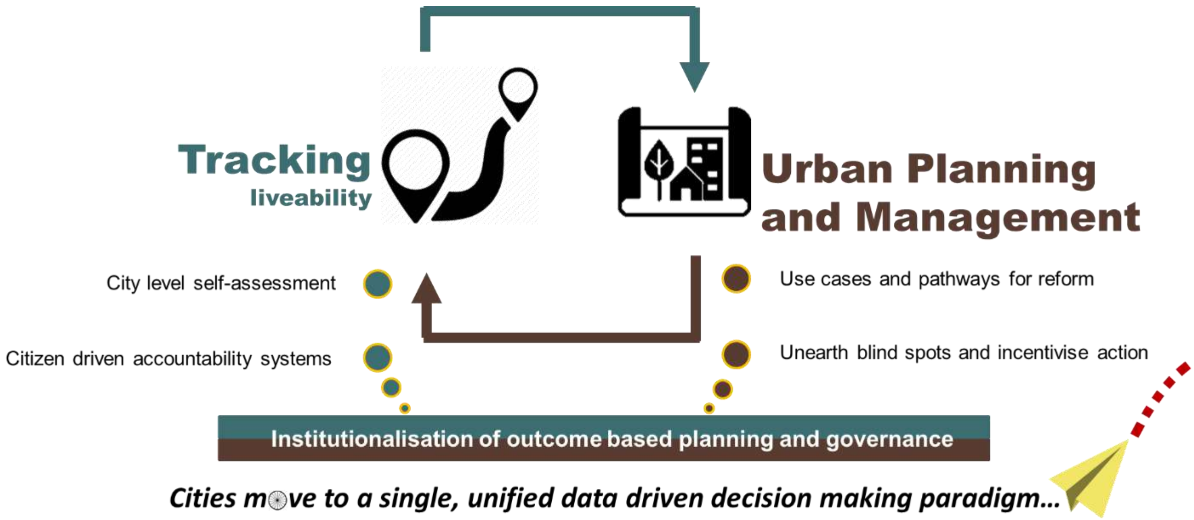
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PIMPRI CHINCHWAD

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km^2)**	181	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1727692
Total Number of Households	419385

SOCIAL PROFILE

Education	**Total Number of Schools**	650
	Total Enrolment (Class 1 to 5)	173381
Health	**Total Number of In-patients Beds**	9948
	Total Health Workforce	8715
Safety and Security	**Total Strength of Police Force**	1565
	Total Number of CCTV Cameras	1035
Heritage Sites	**Total Number of Heritage Sites**	2

ECONOMIC PROFILE

Total Population in Working Age Group	1303617
Total Number of Industries	3417
Total Number of Commercial Enterprises	61320
Total Number of Hotels	143
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	176595.6554
Total VAT Collection in FY 2016-17 (INR Lakhs)	12073.4

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	450
		Total Number of Water Connections	119308
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	410845
		Total number of households in the city with access to community toilets in the city	22884
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	853.863
		Total number of households covered through door-to-door collection of solid waste	378861
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	280
		Daily average quantum of waste water treated by STPs in the city (MLD)	280
	Electricity	**Total number of authorized electrical connections in the city**	593455
		Total electricity supplied to the city (kWh)	3251718595
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	15895
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1148.628
		Total length of arterial and sub-arterial road network in the city (Km)	1148.628
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	271.17

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, PCMC Sales tax depårment
Urban Local Body	For Park and Recreation Related Questions	Garden Department, PCMC Civil Department, PCMC
Urban Local Body	For Water Supply and Drainage related questions	Water Supply Department, PCMC
Urban Local Body	For Heritage sites related data	Town Planning Department, PCMC
Urban Local Body	For Ecological sites related data	Town Planning Department, PCMC
Urban Local Body	For Housing related data	Housing Department, PCMC
Urban Local Body	For Building plan related data	Building & Planning Department, PCMC
Urban Local Body	For Roads related data	Roads Department, PCMC
Urban Local Body	For Solid waste management related data	Waste management Department, PCMC Drainage Department, PCMC
Urban Local Body	For IT services related data	IT Department, PCMC
Urban Local Body	For Vendor committee related data	PCMC
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Environment Department, PCMC
Development Authority	Building Infrastructure	Building & Planning Department, PCMC
	Construction planning	Town Planning, PCMC
	Green Building	Building & Planning Department, PCMC
	Rain water harvesting	Building & Planning Department, PCMC
	Universal Design Principle	Building & Planning Department, PCMC

Designated data owners	Subcategories	Data owners at city level
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Department, PCMC Maharashtra Electricity Board,
State Disaster management authority		Disaster Department, PCMC
State Education Department		State Education Department Education Department, PCMC
State Health Department	Health care professionals	Health Department, PCMC
	Citizen Services	Health Department, PCMC
	Disease Prevalence	Health Department, PCMC
	Health Infrastructure	Health Department, PCMC
State Renewable Energy Development Agency		Maharashtra Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Sales and commercial Taxes department

Transport Authorities	Buses	Road and Transport Office
	Registered Vehicles	Road Transport system, PCMC
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 90 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**4**
DISCOM/Electricity Department	**1**
Traffic and Police Department	**2**
Development Authority	**1**
Pollution Control Board	**0**
State Renewable Energy Department	**6**
Town and Country Planning	**0**
State Health Department	**2**
Transport Authority	**8**
Disaster Management	**0**
Urban Local Body	**66**
Total	**90***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	52.98%
Identity & Culture	15%
Education	82%
Health	78%
Safety & Security	61%
Economy & Employment	11%
Housing & Inclusiveness	1%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	49%
Transport & Mobility	63%
Assured Water Supply	96%
Waste Water Management	73%
Solid Waste Management	74%
Reduced Pollution	80%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in

public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.

#	Challenges	Proposed Solutions
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.

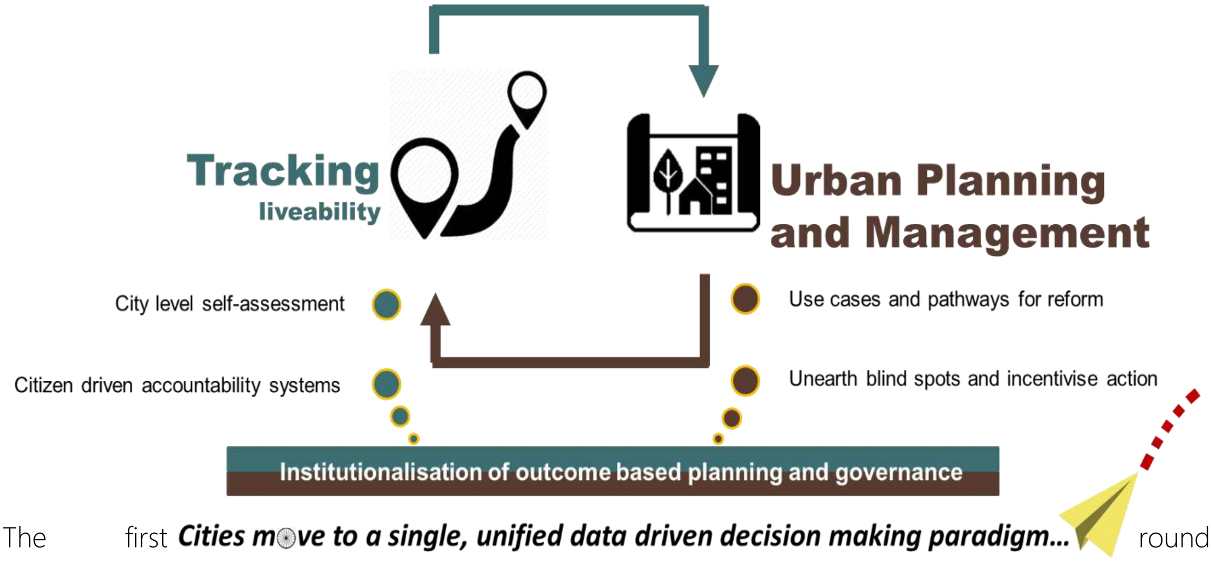
#	Challenges	Proposed Solutions
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability

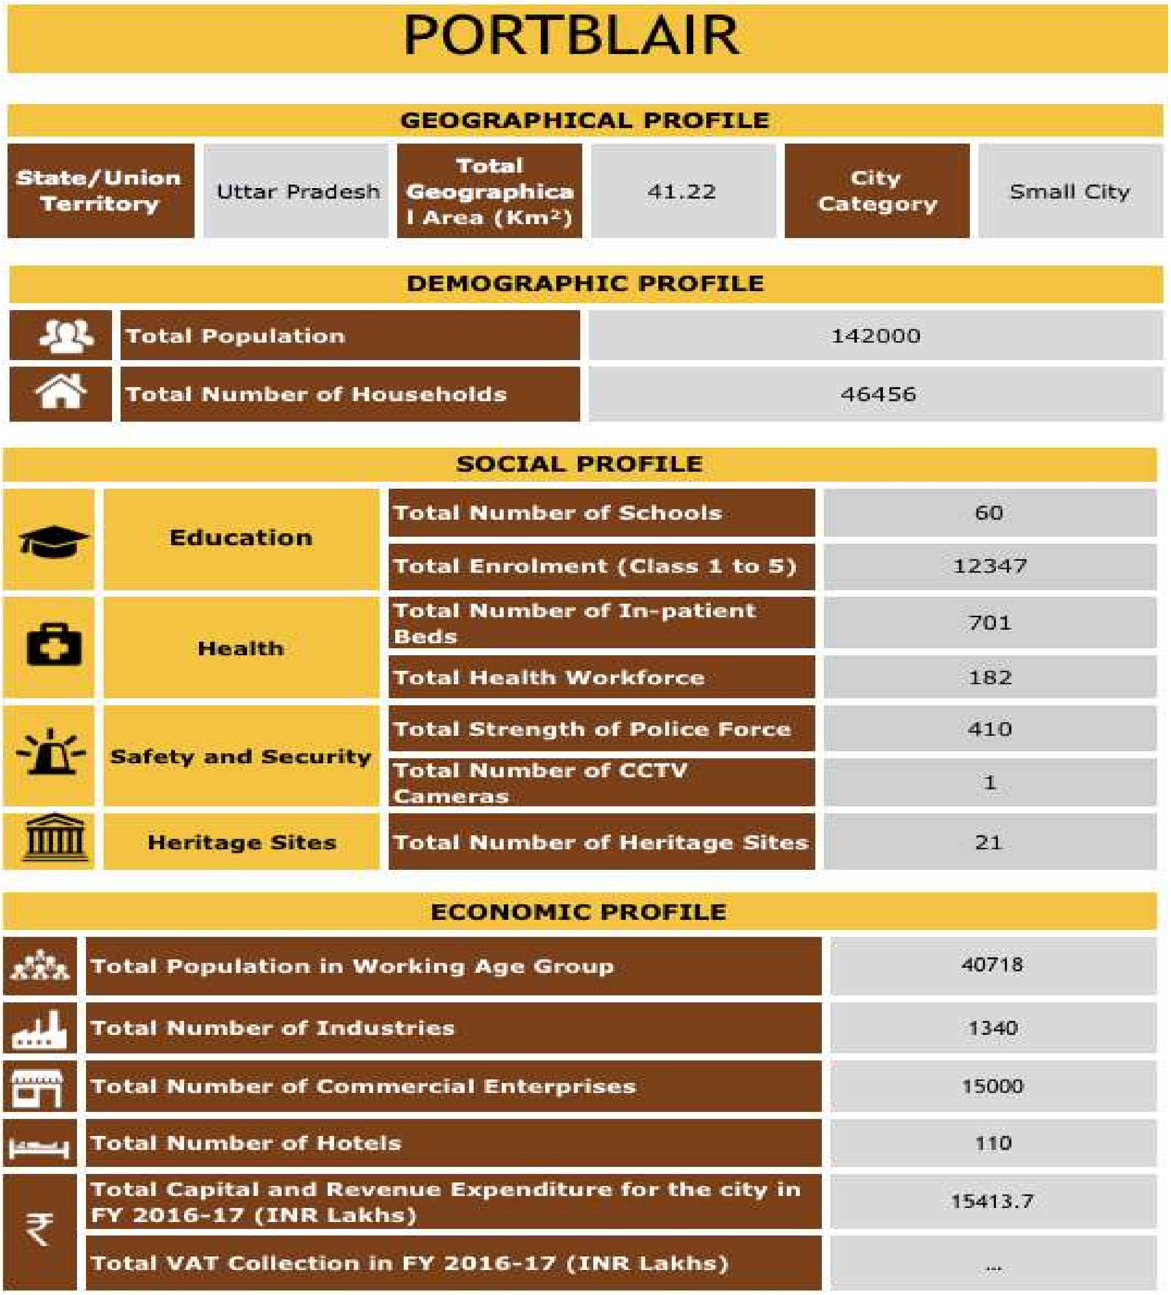
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities m⊙ve to a single, unified data driven decision making paradigm...

The first round

of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



PORTBLAIR

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	Total Geographical Area (Km²)	41.22	City Category	Small City

DEMOGRAPHIC PROFILE

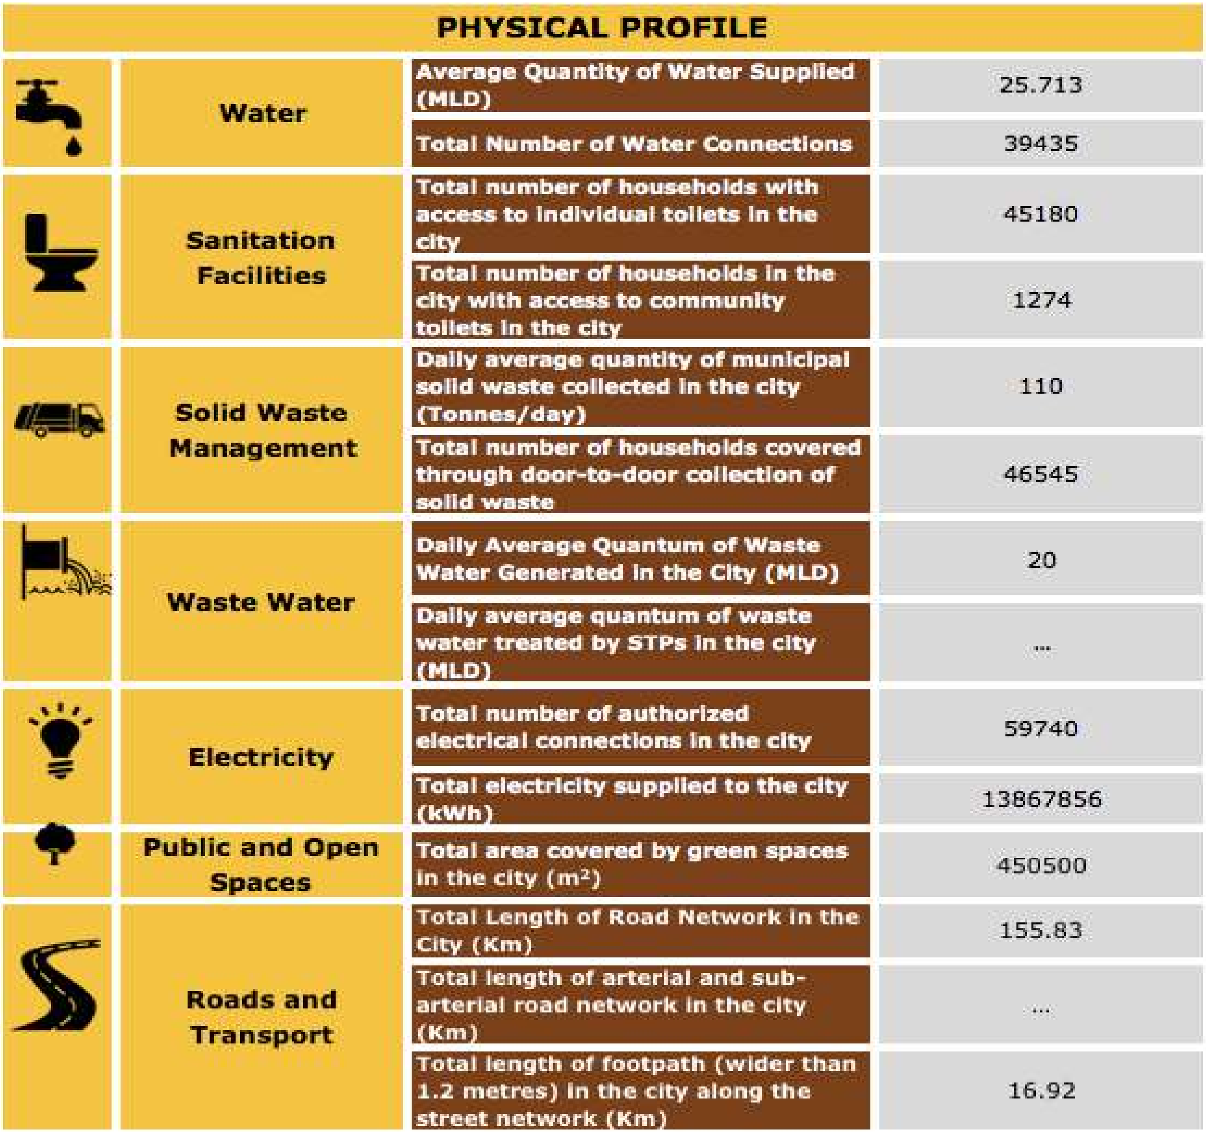
Total Population	142000
Total Number of Households	46456

SOCIAL PROFILE

Education	Total Number of Schools	60
	Total Enrolment (Class 1 to 5)	12347
Health	Total Number of In-patient Beds	701
	Total Health Workforce	182
Safety and Security	Total Strength of Police Force	410
	Total Number of CCTV Cameras	1
Heritage Sites	Total Number of Heritage Sites	21

ECONOMIC PROFILE

Total Population in Working Age Group	40718
Total Number of Industries	1340
Total Number of Commercial Enterprises	15000
Total Number of Hotels	110
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	15413.7
Total VAT Collection in FY 2016-17 (INR Lakhs)	...



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	25.713
	Total Number of Water Connections	39435
Sanitation Facilities	Total number of households with access to individual toilets in the city	45180
	Total number of households in the city with access to community toilets in the city	1274
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	110
	Total number of households covered through door-to-door collection of solid waste	46545
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	20
	Daily average quantum of waste water treated by STPs in the city (MLD)	...
Electricity	Total number of authorized electrical connections in the city	59740
	Total electricity supplied to the city (kWh)	13867856
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	450500
Roads and Transport	Total Length of Road Network in the City (Km)	155.83
	Total length of arterial and sub-arterial road network in the city (Km)	...
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	16.92

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities

Pillars of Comprehensive Development	Category	Indicators
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal

Pillars of Comprehensive Development	Category	Indicators
		spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport

Pillars of Comprehensive Development	Category	Indicators
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water

Pillars of Comprehensive Development	Category	Indicators
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

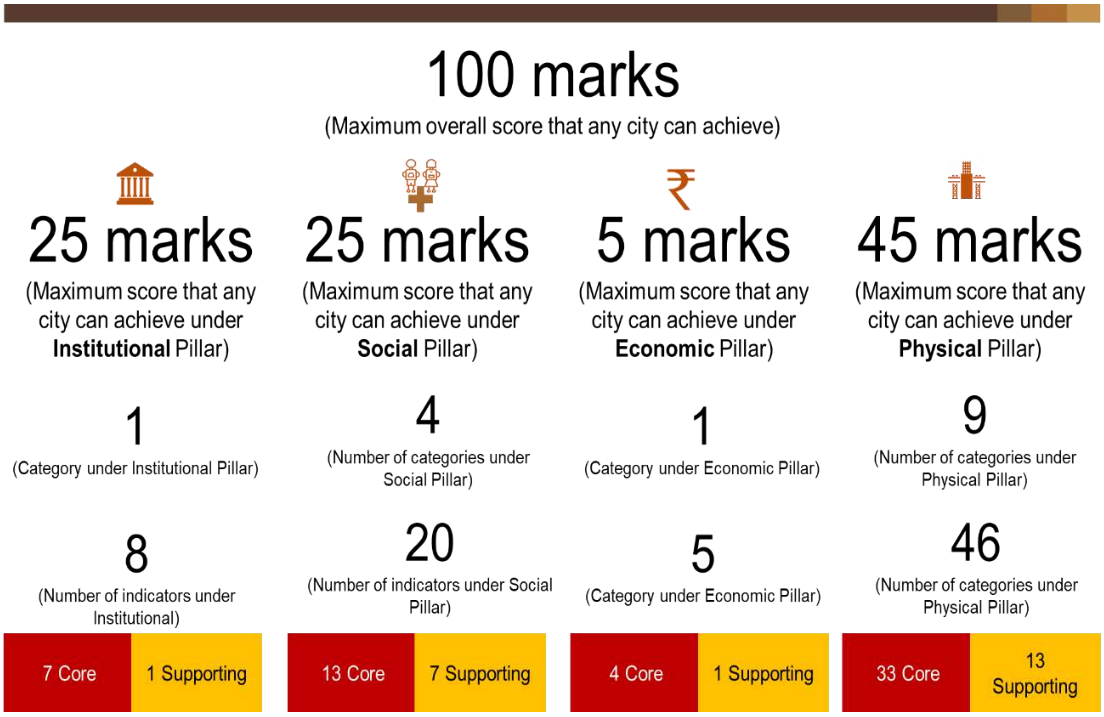
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core | 1 Supporting

25 marks
(Maximum score that any city can achieve under **Social** Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core | 7 Supporting

5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core | 1 Supporting

45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions

on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Port Blair Municipal Council
Urban Local Body	For Park and Recreation Related Questions	Port Blair Municipal Council
Urban Local Body	For Water Supply and Drainage related questions	Port Blair Municipal Council
Urban Local Body	For Heritage sites related data	ART AND CULTURE
Urban Local Body	For Ecological sites related data	FOREST DEPARTMENT
Urban Local Body	For Housing related data	Port Blair Municipal Council
Urban Local Body	For Building plan related data	APWD/ Port Blair Municipal Council
Urban Local Body	For Roads related data	Port Blair Municipal Council
Urban Local Body	For Solid waste management related data	Port Blair Municipal Council
Urban Local Body	For IT services related data	Port Blair Municipal Council
Urban Local Body	For Vendor committee related data	Port Blair Municipal Council
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	HEALTH, EDUCATION,ELECTRICITY DEPARTMENT,POLLUTION CONTROL,DISASTER MANAGEMENT,APWD,PBMC,STATE TRANSPORT DEPARTMENT,POLICE DEPARTMENT.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	POLLUTION CONTROL / APWD
Development Authority	Building Infrastructure	APWD/ Port Blair Municipal Council
	Construction planning	APWD/ Port Blair Municipal Council
	Green Building	Port Blair Municipal Council

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	Port Blair Municipal Council
	Universal Design Principle	APWD/ Port Blair Municipal Council
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	ELECTRICITY DEPARTMENT
State Disaster management authority		DISASTER MANAGEMENT
State Education Department		DIRECTORATE OF EDUCATION DEPARTMENT
State Health Department	Health care professionals	DD HEALTH
	Citizen Services	DD,PLANNING
	Disease Prevalence	DD, HEALTH
	Health Infrastructure	NRHM & STATE HEALTH SOCIETY
State Renewable Energy Development Agency		ELECTRICITY DEPARTMENT
State Sales / Commercial Taxes Department		OFFICE OF DEPUTY COMMISSIONER
Town and Country Planning Department	Land Use	APWD
Traffic and Police Department		POLICE DEPARTMENT
Transport Authorities	Buses	STATE TRANSPORT DEPARMENT
	Registered Vehicles	STATE TRANSPORT DEPARMENT
	Sub urban rail transport	NOT APPLICABLE
	Mono Rail Authority	NOT APPLICABLE
	Tramways	NOT APPLICABLE
	Marine Transport Authority	MARINE DEPARTMENT

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 40 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	12
Development Authority	0
Pollution Control Board	12
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	1
Transport Authority	0
Disaster Management	1
Urban Local Body	12
Total	40

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. Category wise scores

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	42.36%
Identity & Culture	30%
Education	94%
Health	96%
Safety & Security	61%
Economy & Employment	19%
Housing & Inclusiveness	21%
Public Open Spaces	19%
Mixed Land Use & Compactness	39%
Power Supply	56%
Transport & Mobility	33%
Assured Water Supply	83%
Waste Water Management	41%
Solid Waste Management	77%
Reduced Pollution	98%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as

health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.
The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the con-	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the

#	Challenges	Proposed Solutions
	sortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

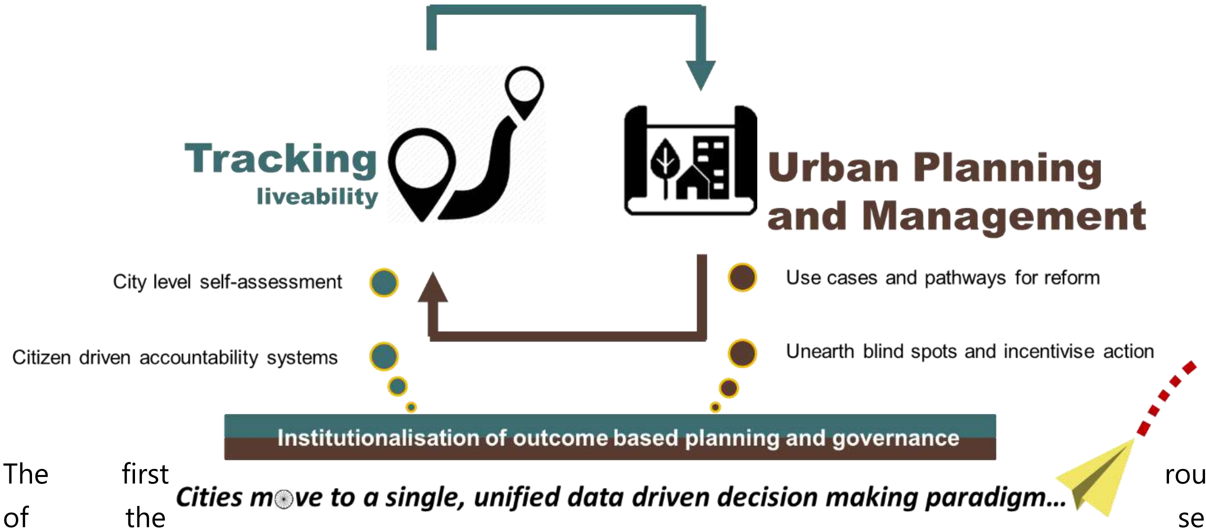
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the sessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PUDUCHERRY

GEOGRAPHICAL PROFILE

State/Union Territory	Puducherry	**Total Geographical Area (Km²)**	19.58	**City Category**	Small City

DEMOGRAPHIC PROFILE

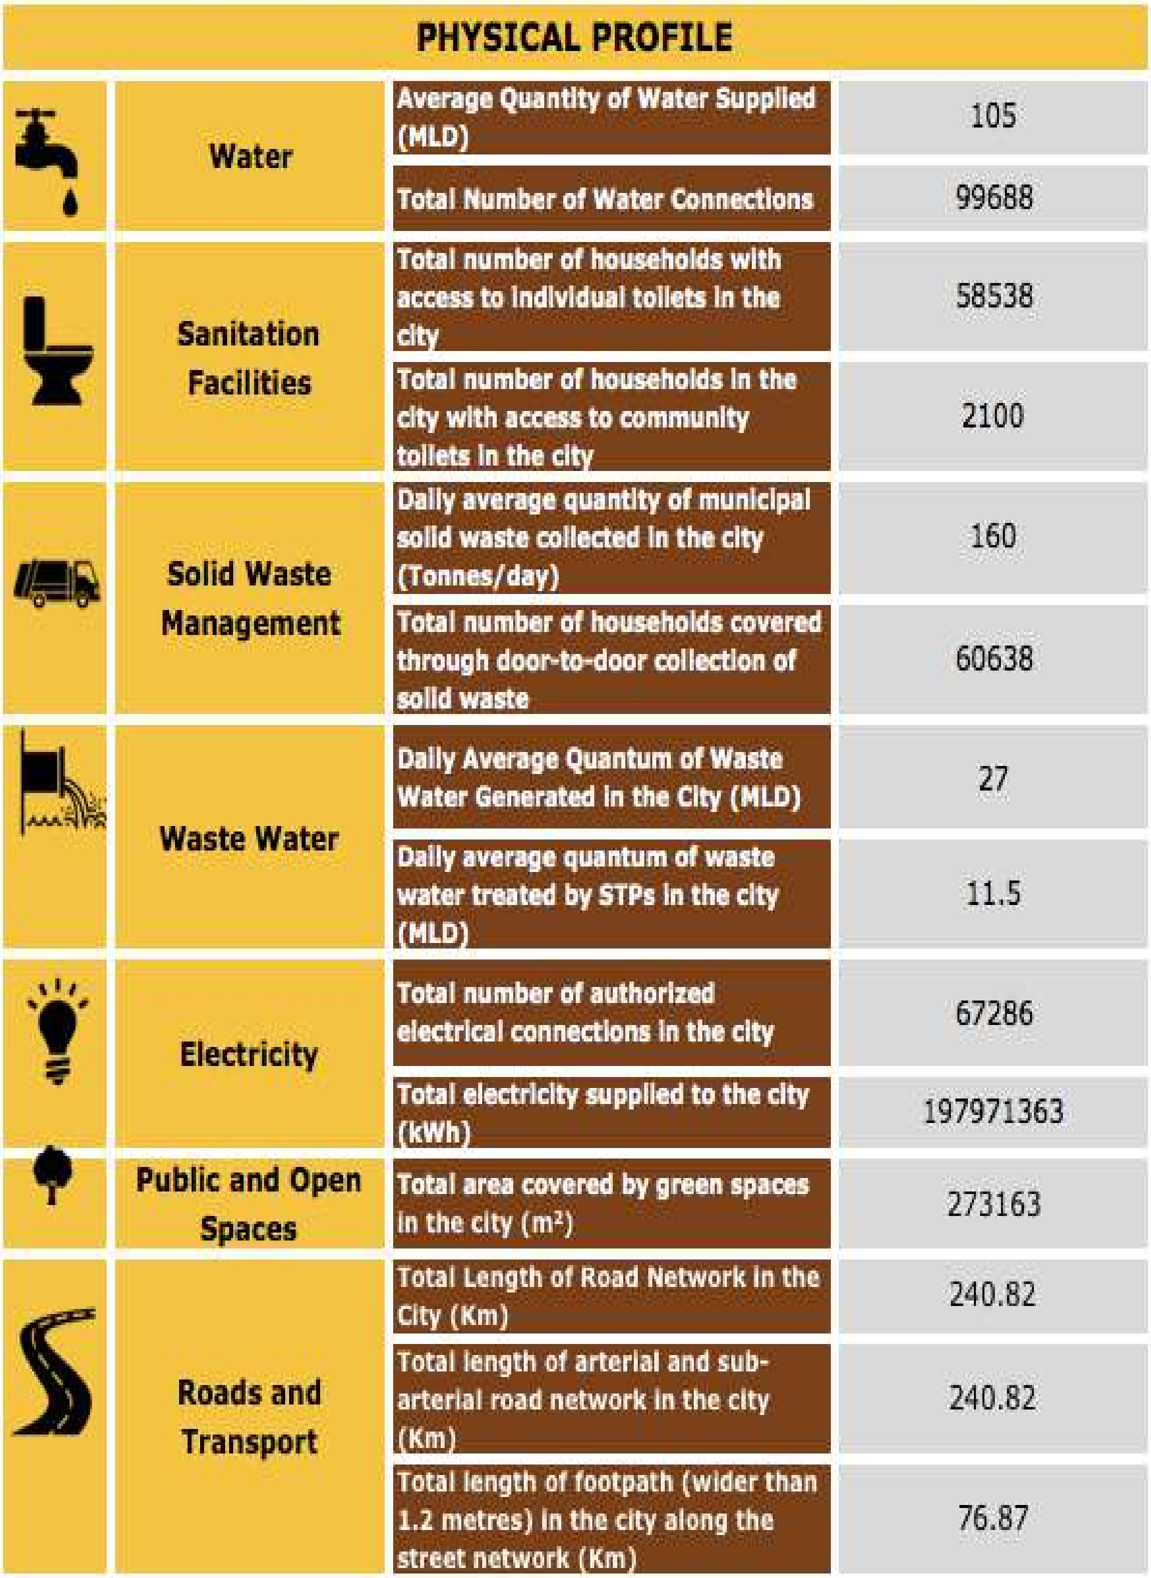
Total Population	244377
Total Number of Households	60638

SOCIAL PROFILE

Education	**Total Number of Schools**	101
	Total Enrolment (Class 1 to 5)	20746
Health	**Total Number of In-patients Beds**	947
	Total Health Workforce	709
Safety and Security	**Total Strength of Police Force**	1685
	Total Number of CCTV Cameras	168
Heritage Sites	**Total Number of Heritage Sites**	245

ECONOMIC PROFILE

Total Population in Working Age Group	185776
Total Number of Industries	5
Total Number of Commercial Enterprises	16000
Total Number of Hotels	141
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	4399.24
Total VAT Collection in FY 2016-17 (INR Lakhs)	24365.28



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	105
	Total Number of Water Connections	99688
Sanitation Facilities	Total number of households with access to individual toilets in the city	58538
	Total number of households in the city with access to community toilets in the city	2100
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	160
	Total number of households covered through door-to-door collection of solid waste	60638
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	27
	Daily average quantum of waste water treated by STPs in the city (MLD)	11.5
Electricity	Total number of authorized electrical connections in the city	67286
	Total electricity supplied to the city (kWh)	197971363
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	273163
Roads and Transport	Total Length of Road Network in the City (Km)	240.82
	Total length of arterial and sub-arterial road network in the city (Km)	240.82
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	76.87

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive

development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and**	6.1 Increase in VAT/GST collection

Pillars of Comprehensive Development	Category	Indicators
	Employment	6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms

Pillars of Comprehensive Development	Category	Indicators
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility

Pillars of Comprehensive Development	Category	Indicators
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

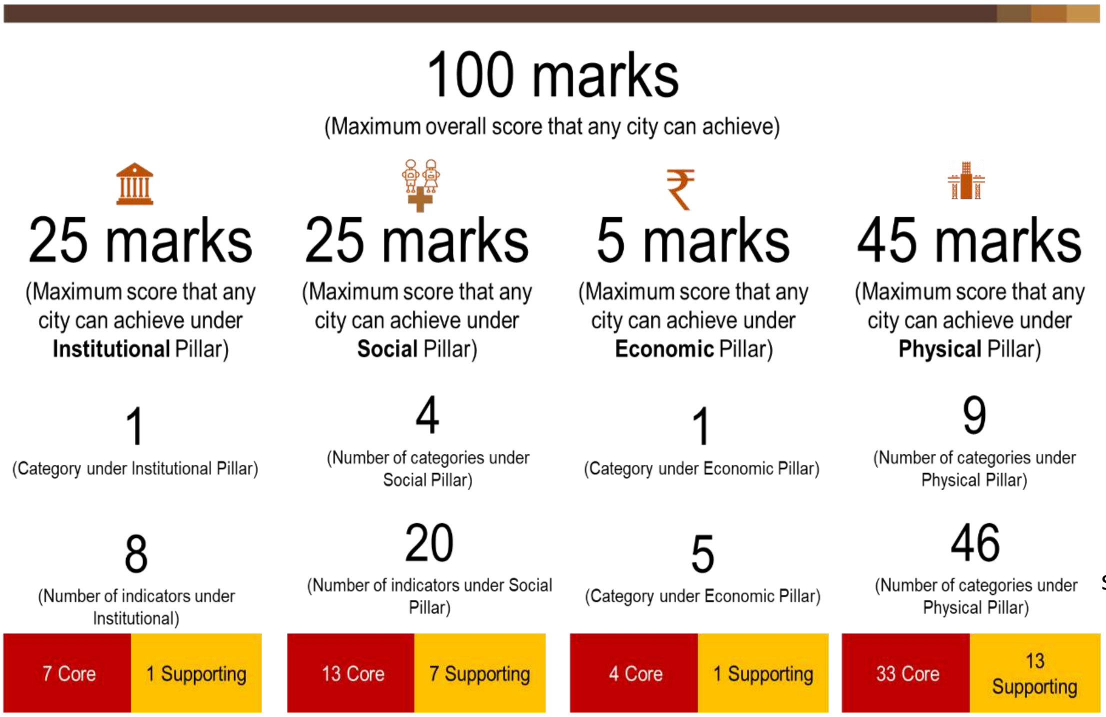
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Pondicherry Municipality
Urban Local Body	For Park and Recreation Related Questions	Pondicherry Municipality
Urban Local Body	For Water Supply and Drainage related questions	Public Works Department
Urban Local Body	For Heritage sites related data	Department of Art and Culture
Urban Local Body	For Ecological sites related data	Department of Forest and wildlife
Urban Local Body	For Housing related data	Puducherry Slum Clearance Board & Puducherry Planning Authority
Urban Local Body	For Building plan related data	Puducherry Planning Authority
Urban Local Body	For Roads related data	Pondicherry Municipality / Transport Department
Urban Local Body	For Solid waste management related data	Pondicherry Municipality/ Swatchitha Corporation
Urban Local Body	For IT services related data	Pondicherry Municipality IT wing
Urban Local Body	For Vendor committee related data	Pondicherry Municipality (Revenue Office)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Pondicherry Municipality
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board, Department of Science and Technology and Public Works Department-Water supply
Development Authority	Building Infrastructure	Puducherry Planning Authority
	Construction planning	Puducherry Planning Authority

	Green Building	Puducherry Planning Authority
	Rain water harvesting	Puducherry Planning Authority
	Universal Design Principle	Puducherry Planning Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Department
State Disaster management authority		Revenue Officer –Disaster Management, Puducherry Collectorate
State Education Department		Department of School Education
State Health Department	Health care professionals	Department of Health and Family Welfare
	Citizen Services	Department of Health and Family Welfare
	Disease Prevalence	Department of Health and Family Welfare
	Health Infrastructure	Department of Health and Family Welfare
State Renewable Energy Development Agency		Renewable Energy Agency, Puducherry
State Sales / Commercial Taxes Department		Department of Commercial Taxes
Town and Country Planning Department	Land Use	Puducherry Planning Authority
Traffic and Police Department		Police/Police Department
Transport Authorities	Buses	Transport Department
	Registered Vehicles	Transport Department
	Sub urban rail transport	NA
	Mono Rail Authority	NA

	Tramways	NA
	Marine Transport Authority	NA

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 59 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	2
DISCOM/Electricity Department	1
Traffic and Police Department	7
Development Authority	0
Pollution Control Board	4
State Renewable Energy Department	1
Town and Country Planning	0
State Health Department	2
Transport Authority	1
Disaster Management	0

Urban Local Body	39
Total	59

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	Scores in Percentage
Governance	58.56%
Identity & Culture	37%
Education	92%
Health	94%
Safety & Security	53%
Economy & Employment	29%
Housing & Inclusiveness	4%
Public Open Spaces	6%
Mixed Land Use & Compactness	3%
Power Supply	46%
Transport & Mobility	41%
Assured Water Supply	79%
Waste Water Management	71%
Solid Waste Management	100%
Reduced Pollution	60%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

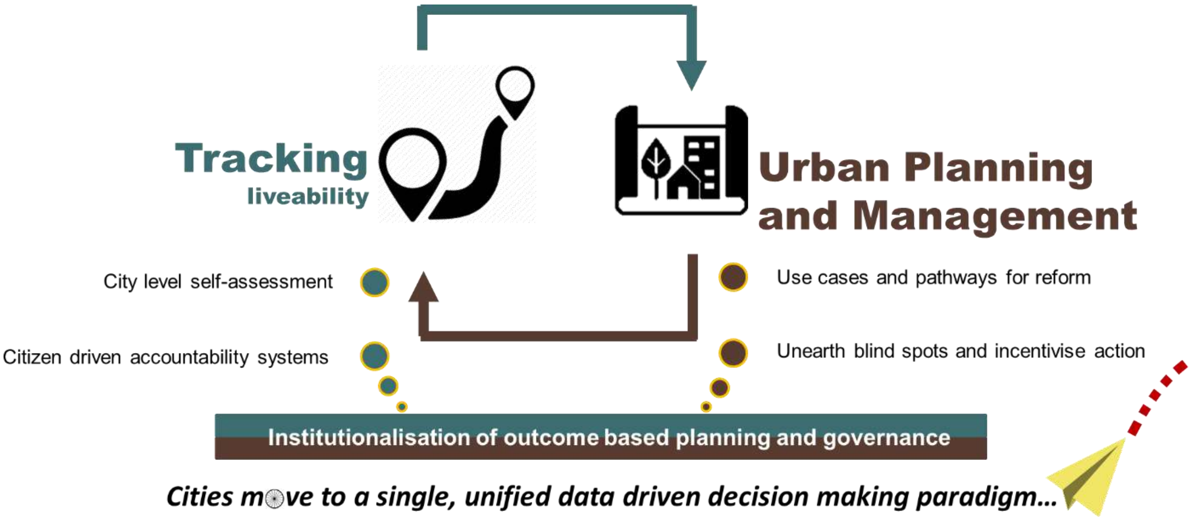
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more ‘liveable.’ The overarching goal of these initiatives is to move from an input-based approach to a ‘citizen centric-outcome based’ assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of ‘Liveability Standards’ relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an ‘Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city’s liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

PUNE

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km^2)**	332.17	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	3124458
Total Number of Households	881529

SOCIAL PROFILE

Education	**Total Number of Schools**	1254
	Total Enrolment (Class 1 to 5)	270223
Health	**Total Number of In-patients Beds**	15929
	Total Health Workforce	35216
Safety and Security	**Total Strength of Police Force**	11245
	Total Number of CCTV Cameras	1322
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	1250100
Total Number of Industries	228
Total Number of Commercial Enterprises	110000
Total Number of Hotels	1390
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	392327
Total VAT Collection in FY 2016-17 (INR Lakhs)	12073.4

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	1300
		Total Number of Water Connections	160000
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	799680
		Total number of households in the city with access to community toilets in the city	72325
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	1560.05
		Total number of households covered through door-to-door collection of solid waste	690692
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	744
		Daily average quantum of waste water treated by STPs in the city (MLD)	477
	Electricity	**Total number of authorized electrical connections in the city**	2086463
		Total electricity supplied to the city (kWh)	9341110000
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	24772500
	Roads and Transport	**Total Length of Road Network in the City (Km)**	2200
		Total length of arterial and sub-arterial road network in the city (Km)	1985
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	600

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Mrs. Ulka Kalaskar CAFO PMC
Urban Local Body	For Park and Recreation Related Questions	Mr. Ashok Ghorpade Superintendent garden dept.
Urban Local Body	For Water Supply and Drainage related questions	V. G. Kulkarni Chief Engg. (Water supply and sewerage), PMC and Mr. Mule A.E.(sewerage) PMC
Urban Local Body	For Heritage sites related data	Mrs. Harshada shinde EE, PMC
Urban Local Body	For Ecological sites related data	Mr. Mangesh Dighe (Environment Officer) PMC
Urban Local Body	For Housing related data	Mr. Dinesh Rokade Dept. director, PMAY, PMC
Urban Local Body	For Building plan related data	Mr.Nillesh Saitwal Building and plan permission
Urban Local Body	For Roads related data	Mr. Anoop Gajjalwar J.E. (project) Road Department.PMC.
Urban Local Body	For Solid waste management related data	Mr. Suresh Jagatap JMC (Solid Waste Management), PMC
Urban Local Body	For IT services related data	Mr. Rahul Jagtap HOD, IT, PMC
Urban Local Body	For Vendor committee related data	Mr. Madhav Jagtap DMC (encroachment), PMC
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Sarv Siksha Abhiyan department, Sport Department,Health Department, STP Department,electricity department ,ward office ,D.P cell, property tax department, bhavan department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Mr.Mangesh Dighe HOD Enviornment Dept
Development	Building Infrastructure	Mr.Nillesh Saitwal

Designated data owners	Subcategories	Data owners at city level
Authority		Building and plan permission Department
	Construction planning	Building and plan permission Department
	Green Building	
	Rain water harvesting	Building and plan permission Department
	Universal Design Principle	Building and plan permission Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Maharashtra State Electricity Distribution Company, Rasta peth, pune.
State Disaster management authority		Disaster Management Cell Pune Municipal Corpporation.
State Education Department		Sarv Shiksha Abhiyan Department
State Health Department	Health care professionals	Health Department,Pune Municipal Corporaton.
	Citizen Services	Health Department,Pune Municipal Corporaton.
	Disease Prevalence	Health Department,Pune Municipal Corporaton.
	Health Infrastructure	Health Department,Pune Municipal Corporaton.
State Renewable Energy Development Agency		Maharashtra State Electricity Distribution Company, Rasta peth, pune and Maharashtra Energy Development Agency,Pune.
State Sales / Commercial Taxes Department		Sales Tax Office,Pune.
Town and Country Planning Department	Land Use	Development Plan cell,Pune Municipal Corporation.
Traffic and Police Department		Traffic head Office and Commissioner of Police Office,pune.
Transport Authorities	Buses	Pune Mhanagar ParivahanMahamandal Limited,, Pune.
	Registered Vehicles	RTO, Pune
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 168 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**7**
DISCOM/Electricity Department	**4**
Traffic and Police Department	**11**
Development Authority	**12**
Pollution Control Board	**5**
State Renewable Energy Department	**2**
Town and Country Planning	**10**
State Health Department	**9**
Transport Authority	**10**
Disaster Management	**2**
Urban Local Body	**94**
Total	**168***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre
2.3 | Hotel occupancy
3.4 | Percentage of schools with access to digital education
5.1| Number of streets, public places, junctions covered through surveillance systems
6.5 | Percentage of vendors registered and provided formal spaces
11.7 | Availability of Passenger Information System
11.11 | Percentage of traffic intersections with pedestrian crossing facilities
11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate
11.3 | Mode share of public transport
11.5 | Mode share of Non Motorized Transport
12.3 | Quality of Water Supplied
15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	61.10%
Identity & Culture	41%
Education	90%
Health	93%
Safety & Security	59%
Economy & Employment	35%
Housing & Inclusiveness	18%
Public Open Spaces	33%
Mixed Land Use & Compactness	3%
Power Supply	50%
Transport & Mobility	30%
Assured Water Supply	91%
Waste Water Management	74%
Solid Waste Management	92%
Reduced Pollution	89%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

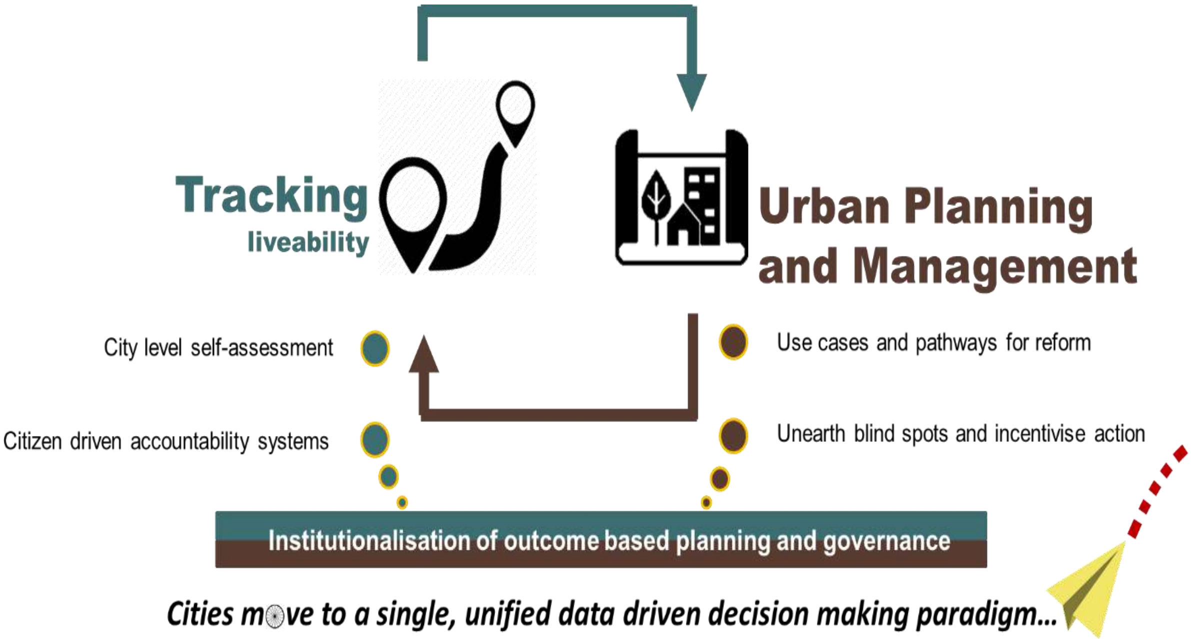
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

RAR BARELI

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km^2)**	43.28	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	210870
Total Number of Households	18467

SOCIAL PROFILE

Education	**Total Number of Schools**	188
	Total Enrolment (Class 1 to 5)	2988
Health	**Total Number of In-patient Beds**	1149
	Total Health Workforce	665
Safety and Security	**Total Strength of Police Force**	119
	Total Number of CCTV Cameras	32
Heritage Sites	**Total Number of Heritage Sites**	47

ECONOMIC PROFILE

Total Population in Working Age Group	60578
Total Number of Industries	91
Total Number of Commercial Enterprises	84
Total Number of Hotels	44
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	124.79
Total VAT Collection in FY 2016-17 (INR Lakhs)	30295

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	85
		Total Number of Water Connections	34920
	Sanitation Facilities	Total number of households with access to individual toilets in the city	35801
		Total number of households in the city with access to community toilets in the city	895
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	50
		Total number of households covered through door-to-door collection of solid waste	19228
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	13
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	Total number of authorized electrical connections in the city	411537
		Total electricity supplied to the city (kWh)	1153580
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	142090
	Roads and Transport	Total Length of Road Network in the City (Km)	364
		Total length of arterial and sub-arterial road network in the city (Km)	364
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	30

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

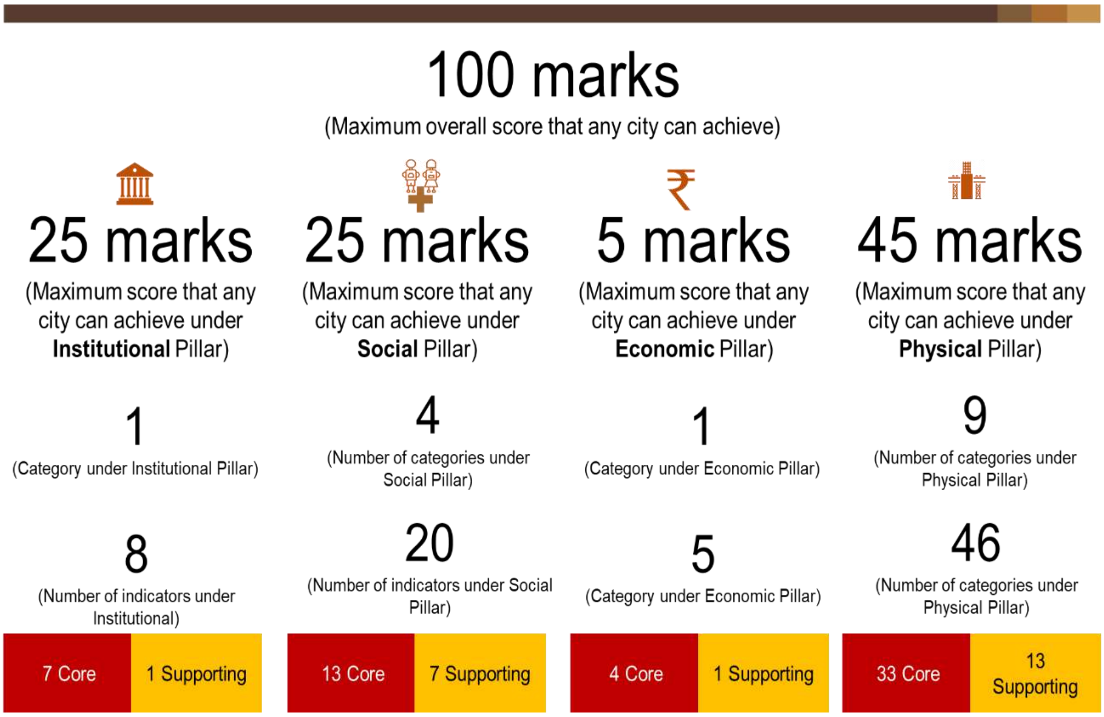
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core | 1 Supporting

25 marks
(Maximum score that any city can achieve under **Social** Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core | 7 Supporting

5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core | 1 Supporting

45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account department, Raebareli Nagar Nigam
Urban Local Body	For Park and Recreation Related Questions	Nirman vibhag, Raebareli Nagar Nigam
Urban Local Body	For Water Supply and Drainage related questions	Jal kal vibhag, Raebareli Nagar Nigam
Urban Local Body	For Heritage sites related data	----
Urban Local Body	For Ecological sites related data	-----
Urban Local Body	For Housing related data	Jan gadana
Urban Local Body	For Building plan related data	Raebareli Development Authority
Urban Local Body	For Roads related data	Nirman vibhag, Raebareli Nagar Nigam
Urban Local Body	For Solid waste management related data	Health department, Raebareli Nagar Nigam
Urban Local Body	For IT services related data	Health department, tax Department
Urban Local Body	For Vendor committee related data	Revenue Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Account, light, jal kal public work construction
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Regional office of state Pollution control Board
Development Authority	Building Infrastructure	Raebareli Development authority
	Construction planning	Raebareli Development authority

Designated data owners	Subcategories	Data owners at city level
	Green Building	Raebareli Development authority
	Rain water harvesting	Raebareli Development authority
	Universal Design Principle	Raebareli Development authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Office of the Executive Engineer vidut vitreren khend - first
State Disaster management authority		Office of additional district mejistret finance and Revenue
State Education Department		Office of basic shiksha adhikari
State Health Department	Health care professionals	Office of chief medical officer
	Citizen Services	Office of chief medical officer
	Disease Prevalence	Office of chief medical officer
	Health Infrastructure	Office of chief medical officer
State Renewable Energy Development Agency	Renewable Energy	District Renewable Energy Development Agency
State Sales / Commercial Taxes Department		District sales/ Commercial Taxes Department
Town and Country Planning Department	Land Use	Development Authority
Traffic and Police Department		
Transport Authorities	Buses	Office of Road ways
	Registered Vehicles	Office of Road Transport officer
	Sub urban rail transport	--
	Mono Rail Authority	--
	Tramways	--
	Marine Transport Authority	--

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 12 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**0**
State Education Department	**0**
DISCOM/Electricity Department	**0**
Traffic and Police Department	**1**
Development Authority	**1**
Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**1**
State Health Department	**0**
Transport Authority	**0**
Disaster Management	**0**
Urban Local Body	**9**
Total	**12***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	50.18%
Identity & Culture	18%
Education	26%
Health	97%
Safety & Security	60%
Economy & Employment	26%
Housing & Inclusiveness	0%
Public Open Spaces	5%
Mixed Land Use & Compactness	33%
Power Supply	49%
Transport & Mobility	13%
Assured Water Supply	73%
Waste Water Management	43%
Solid Waste Management	85%
Reduced Pollution	59%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection,

timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

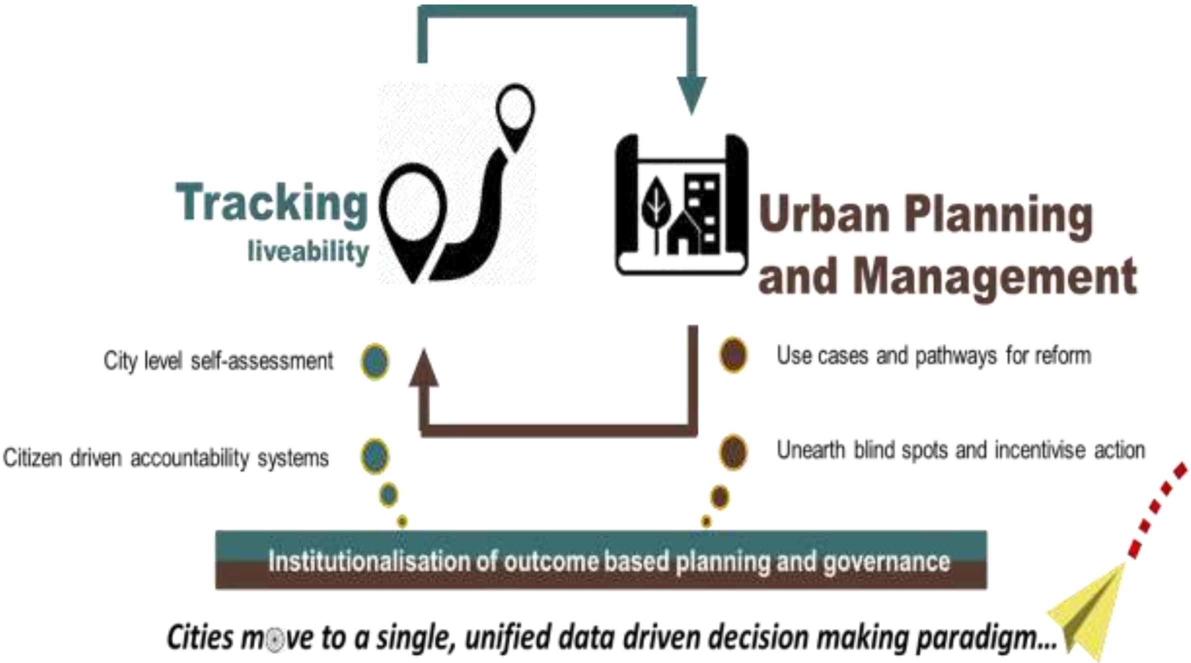
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

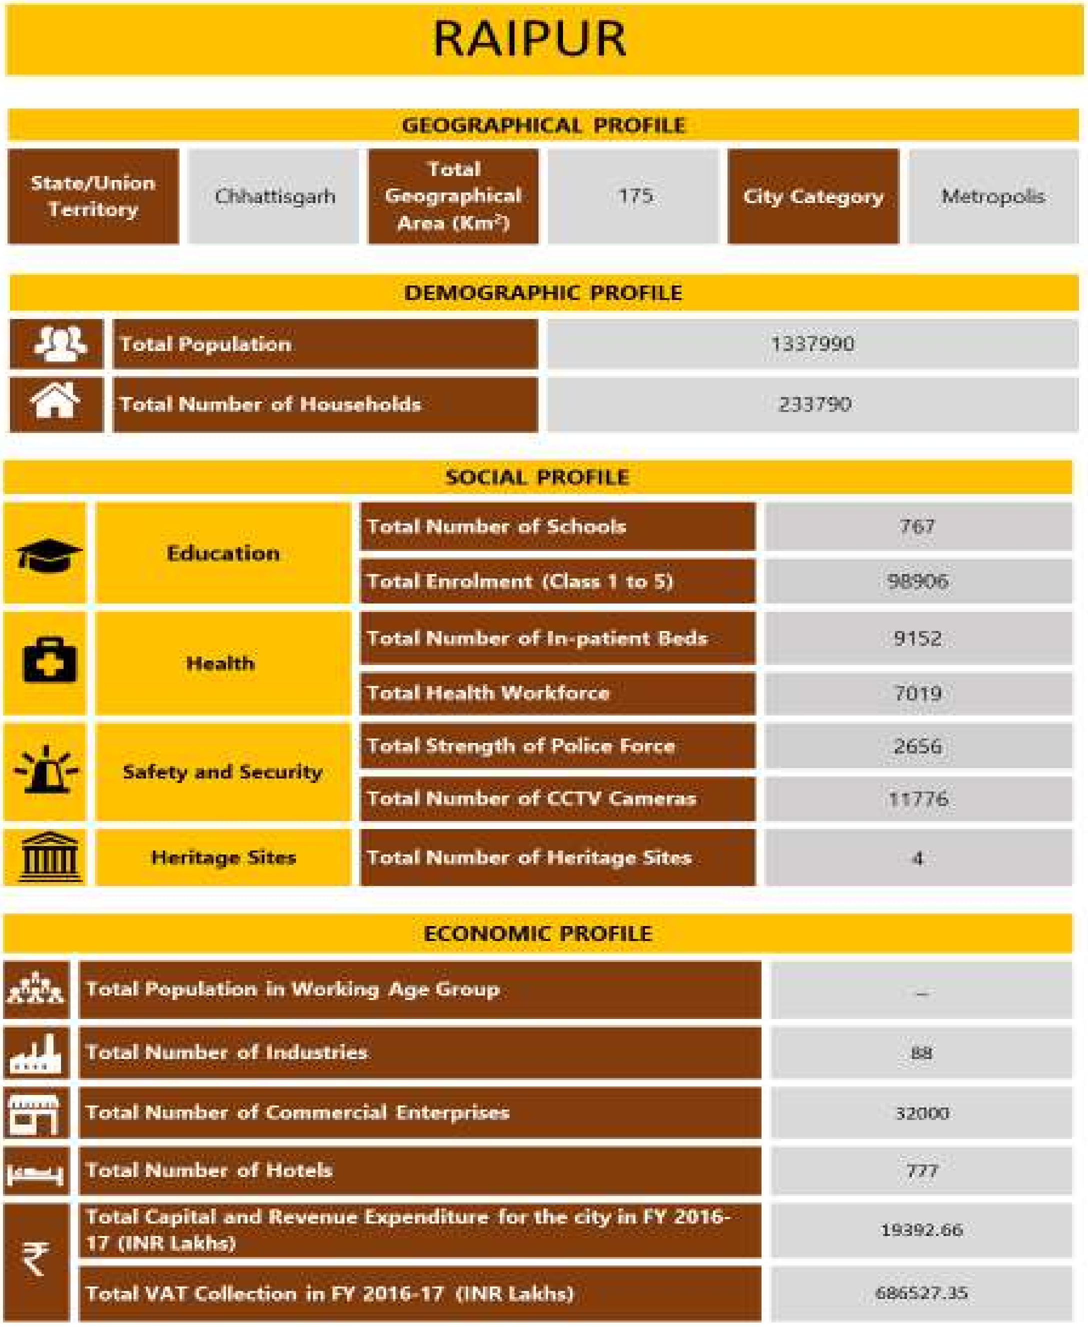


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



RAIPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Chhattisgarh	Total Geographical Area (Km²)	175	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1337990
Total Number of Households	233790

SOCIAL PROFILE

Education	Total Number of Schools	767
	Total Enrolment (Class 1 to 5)	98906
Health	Total Number of In-patient Beds	9152
	Total Health Workforce	7019
Safety and Security	Total Strength of Police Force	2656
	Total Number of CCTV Cameras	11776

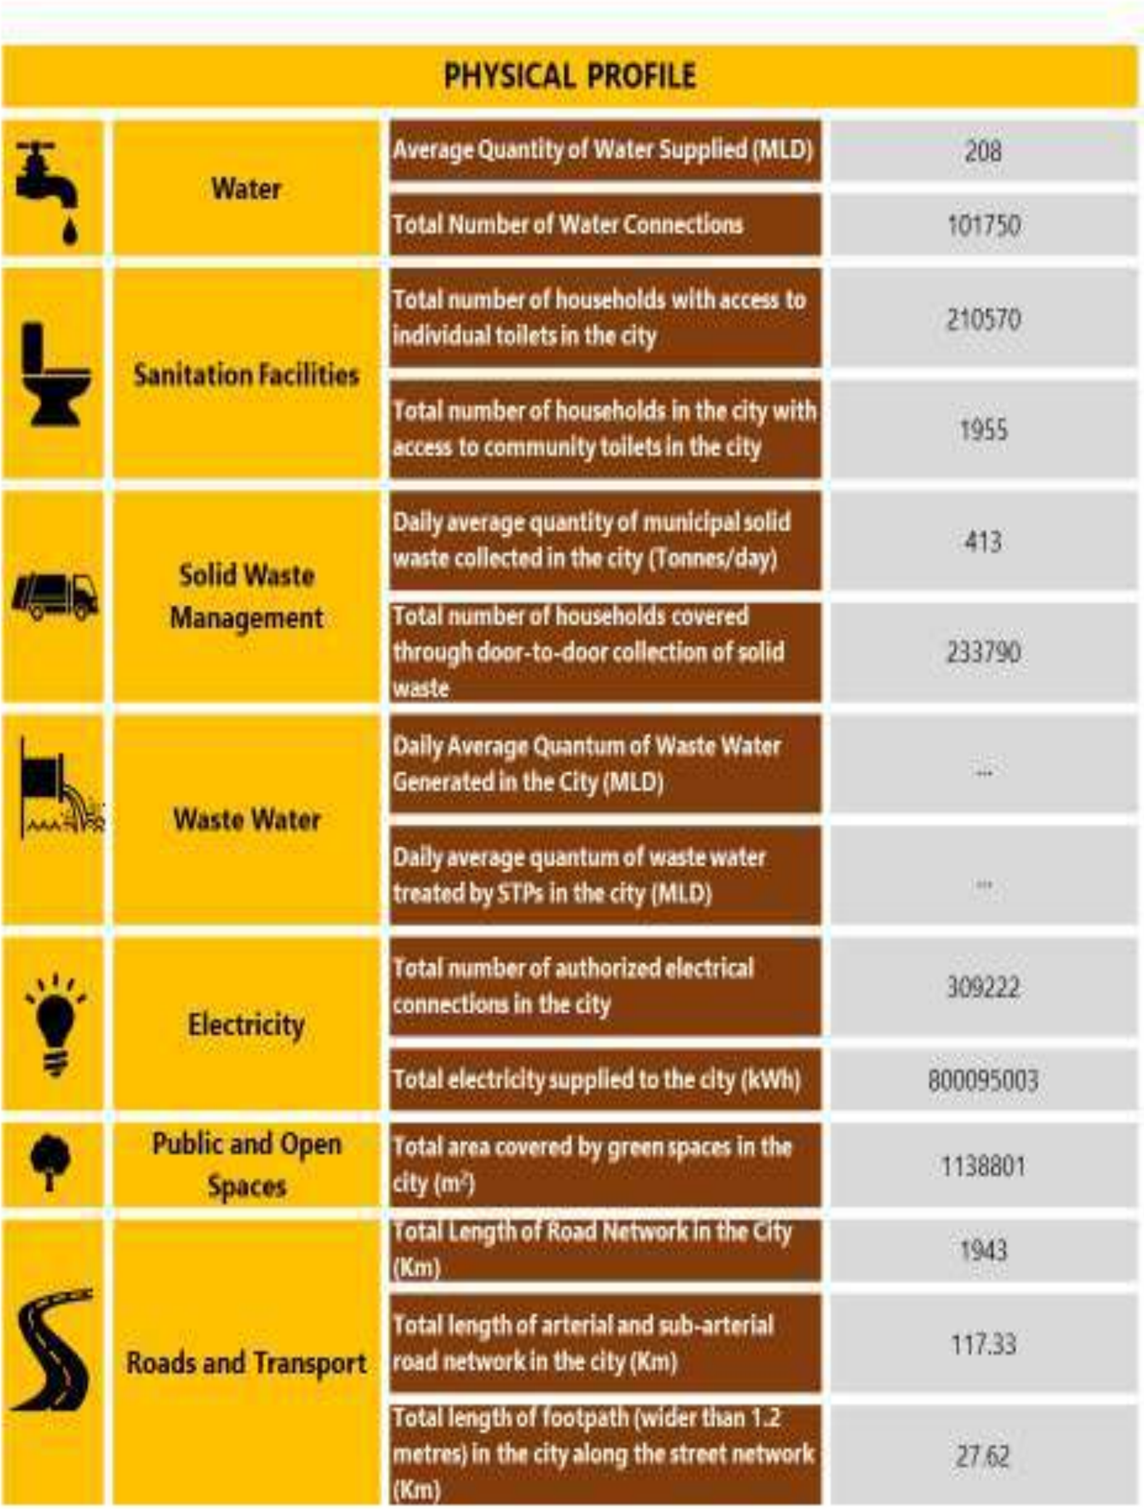
ECONOMIC PROFILE

Total Population in Working Age Group	–
Total Number of Industries	88
Total Number of Commercial Enterprises	32000
Total Number of Hotels	777
₹ Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	19392.66
Total VAT Collection in FY 2016-17 (INR Lakhs)	686527.35



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	208
	Total Number of Water Connections	101750
Sanitation Facilities	Total number of households with access to individual toilets in the city	210570
	Total number of households in the city with access to community toilets in the city	1955
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	413
	Total number of households covered through door-to-door collection of solid waste	233790
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	---
	Daily average quantum of waste water treated by STPs in the city (MLD)	---
Electricity	Total number of authorized electrical connections in the city	309222
	Total electricity supplied to the city (kWh)	800095003
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1138801
Roads and Transport	Total Length of Road Network in the City (Km)	1943
	Total length of arterial and sub-arterial road network in the city (Km)	117.33
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	27.62

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

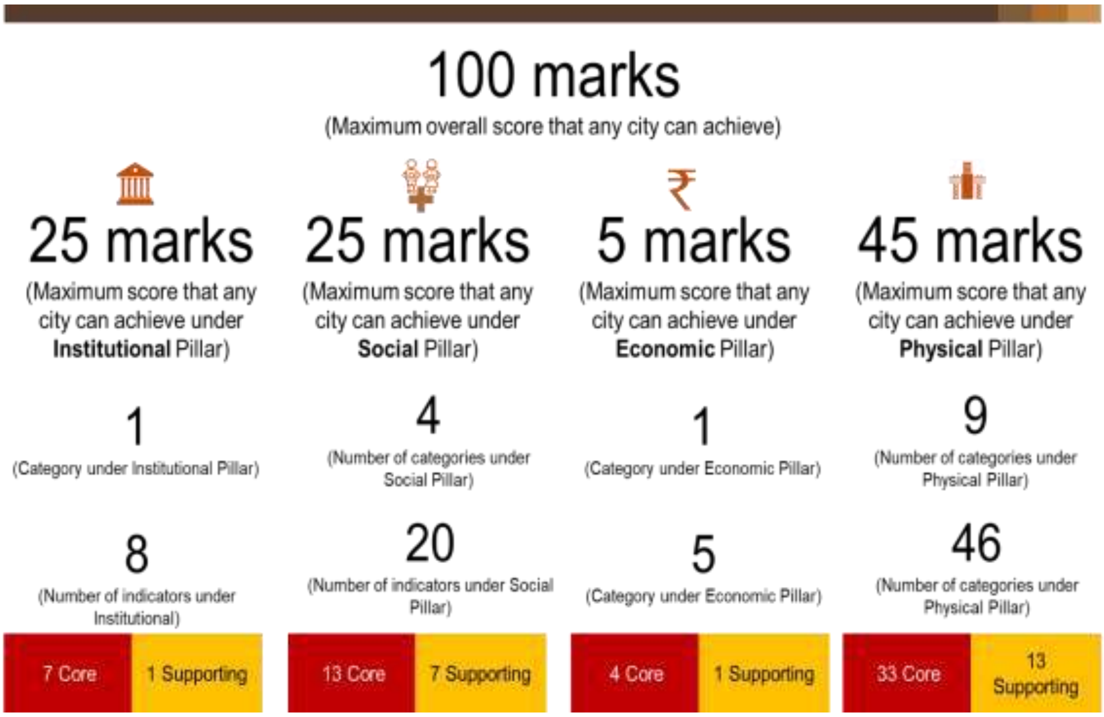
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department, RMC
Urban Local Body	For Park and Recreation Related Questions	AMRUT, RMC
Urban Local Body	For Water Supply and Drainage related questions	Water Supply Department, RMC
Urban Local Body	For Heritage sites related data	Indian National Trust for Art and Culture Heritage
Urban Local Body	For Ecological sites related data	NA
Urban Local Body	For Housing related data	Raipur Municipal Corporation
Urban Local Body	For Building plan related data	Raipur Development Authority
Urban Local Body	For Roads related data	Raipur Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid waste management Department, Raipur Municipal Corporation
Urban Local Body	For IT services related data	IT Section, RMC
Urban Local Body	For Vendor committee related data	Bazar Bibhag, RMC
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Employment Exchange, Census Department
For questions under Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Chhattisgarh Pollution Control Board
Development Authority	Building Infrastructure	Raipur Development Authority Raipur Municipal Corporation

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Raipur Development Authority Raipur Municipal Corporation
	Green Building	Raipur Development Authority Raipur Municipal Corporation
	Rain water harvesting	Raipur Development Authority Raipur Municipal Corporation
	Universal Design Principle	Raipur Development Authority Raipur Municipal Corporation
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Chhattisgarh State Power Distribution Corporation Limited
State Disaster management authority		Raipur Smart City Limited
State Education Department		District Education Department
State Health Department	Health care professionals	Chhattisgarh Medical and Health organization
State Health Department	Citizen Services	Chhattisgarh Medical and Health organization
State Health Department	Disease Prevalence	Chhattisgarh Medical and Health organization
State Health Department	Health Infrastructure	Chhattisgarh Medical and Health organization
State Renewable Energy Development Agency		Chhattisgarh Renewable Energy Development Authority
State Sales / Commercial Taxes Department		State Sale Tax department
Town and Country Planning Department	Land Use	Town and country planning department, Raipur
Traffic and Police Department		Police department, Raipur
Transport Authorities	Buses	City Bus In charge, RMC
Transport Authorities	Registered Vehicles	Road and Transport organization
Transport Authorities	Sub urban rail transport	

Designated data owners	Subcategories	Data owners at city level
Transport Authorities	Mono Rail Authority	
Transport Authorities	Tramways	
Transport Authorities	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 189 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

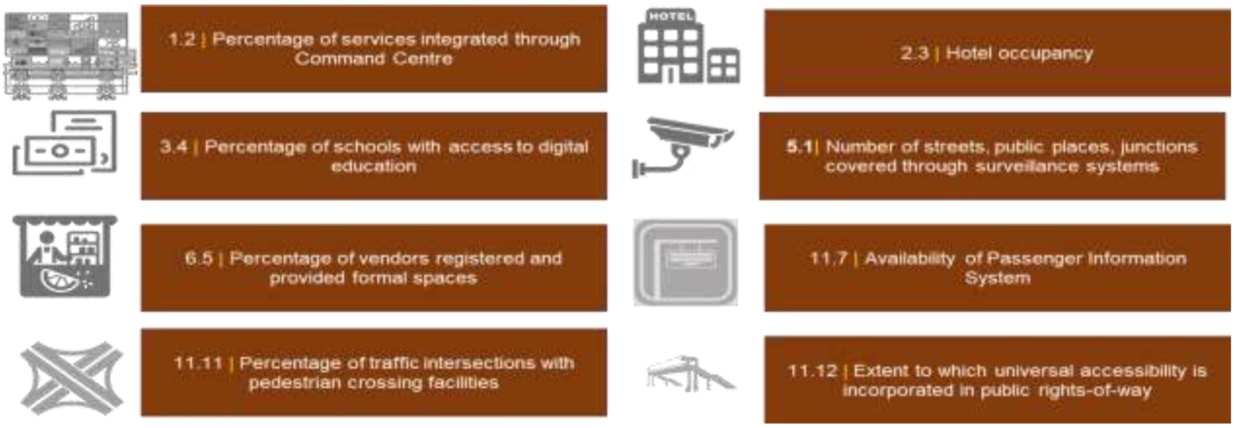
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	4
DISCOM/Electricity Department	16
Traffic and Police Department	25
Development Authority	3
Pollution Control Board	10
State Renewable Energy Department	2
Town and Country Planning	4
State Health Department	24
Transport Authority	9
Disaster Management	1
Urban Local Body	89
Total	189

4.4 Data Verification

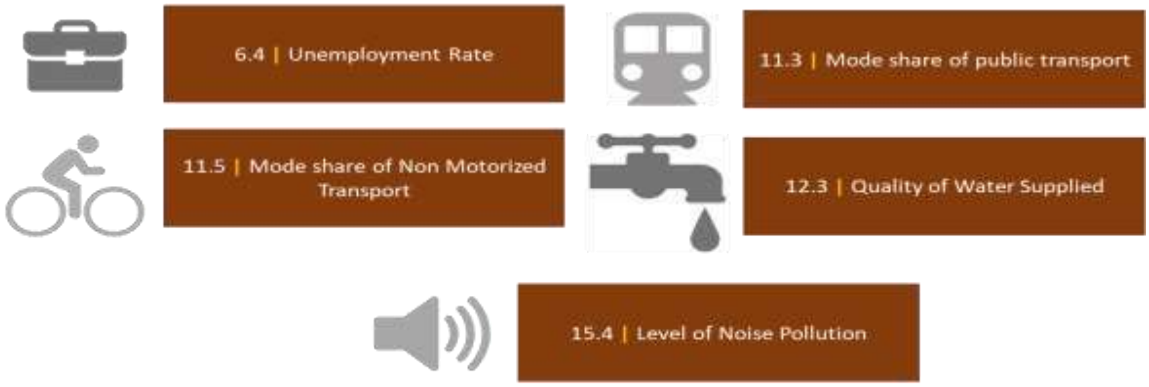
A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre
2.3 | Hotel occupancy
3.4 | Percentage of schools with access to digital education
5.1 | Number of streets, public places, junctions covered through surveillance systems
6.5 | Percentage of vendors registered and provided formal spaces
11.7 | Availability of Passenger Information System
11.11 | Percentage of traffic intersections with pedestrian crossing facilities
11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

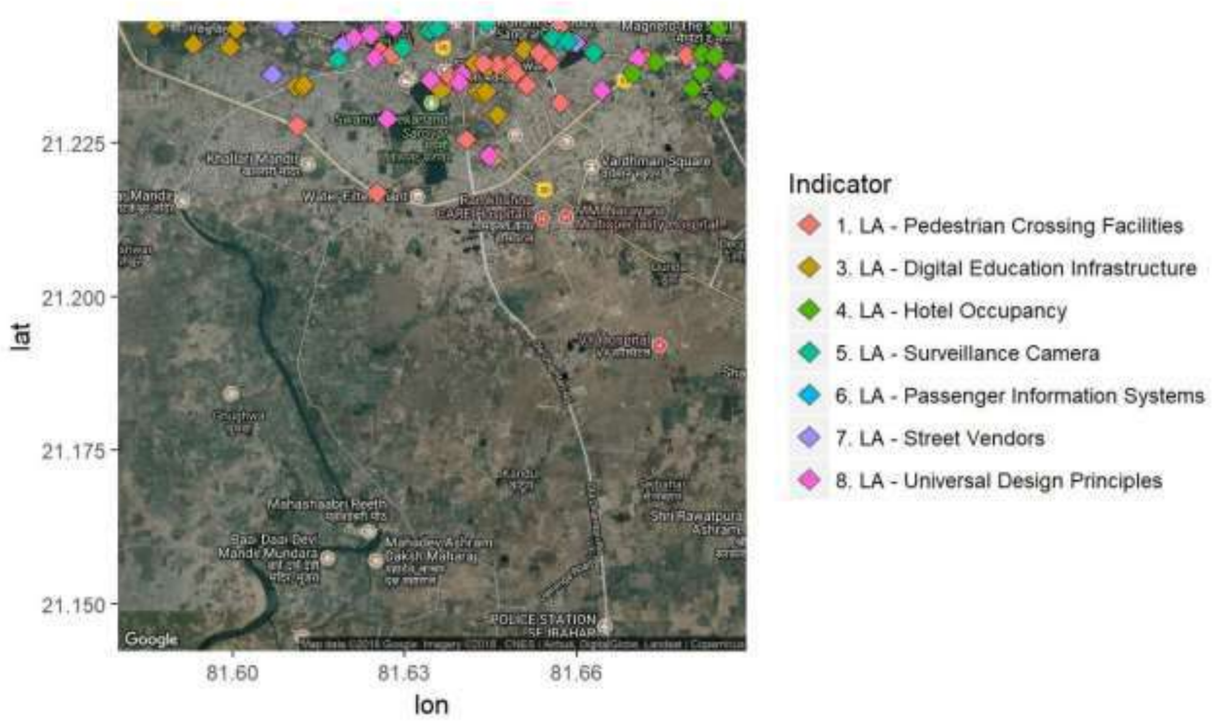
For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



6.4 | Unemployment Rate
11.3 | Mode share of public transport
11.5 | Mode share of Non Motorized Transport
12.3 | Quality of Water Supplied
15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.



21.225

Indicator
1. LA - Pedestrian Crossing Facilities
3. LA - Digital Education Infrastructure
4. LA - Hotel Occupancy
5. LA - Surveillance Camera
6. LA - Passenger Information Systems
7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	61.49%
Identity & Culture	29%
Education	82%
Health	96%
Safety & Security	62%
Economy & Employment	13%
Housing & Inclusiveness	33%
Public Open Spaces	5%
Mixed Land Use & Compactness	19%
Power Supply	55%
Transport & Mobility	42%
Assured Water Supply	80%
Waste Water Management	58%
Solid Waste Management	89%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection,

timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

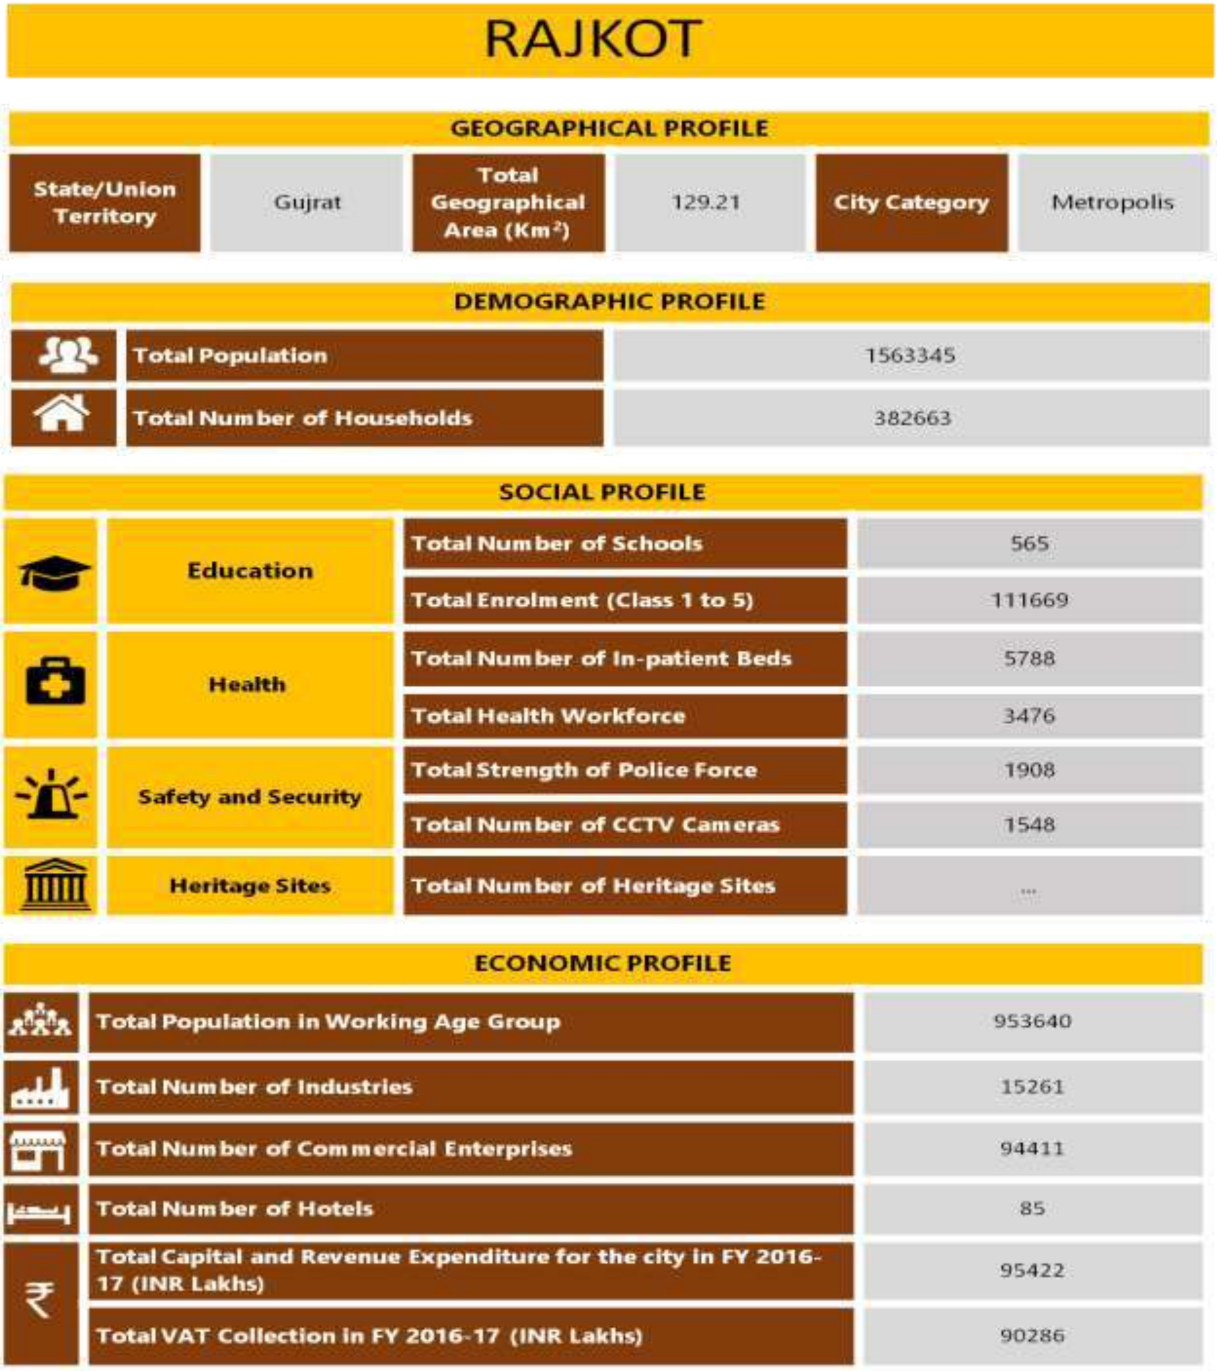
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



RAJKOT

GEOGRAPHICAL PROFILE

State/Union Territory	Gujrat	**Total Geographical Area (Km²)**	129.21	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

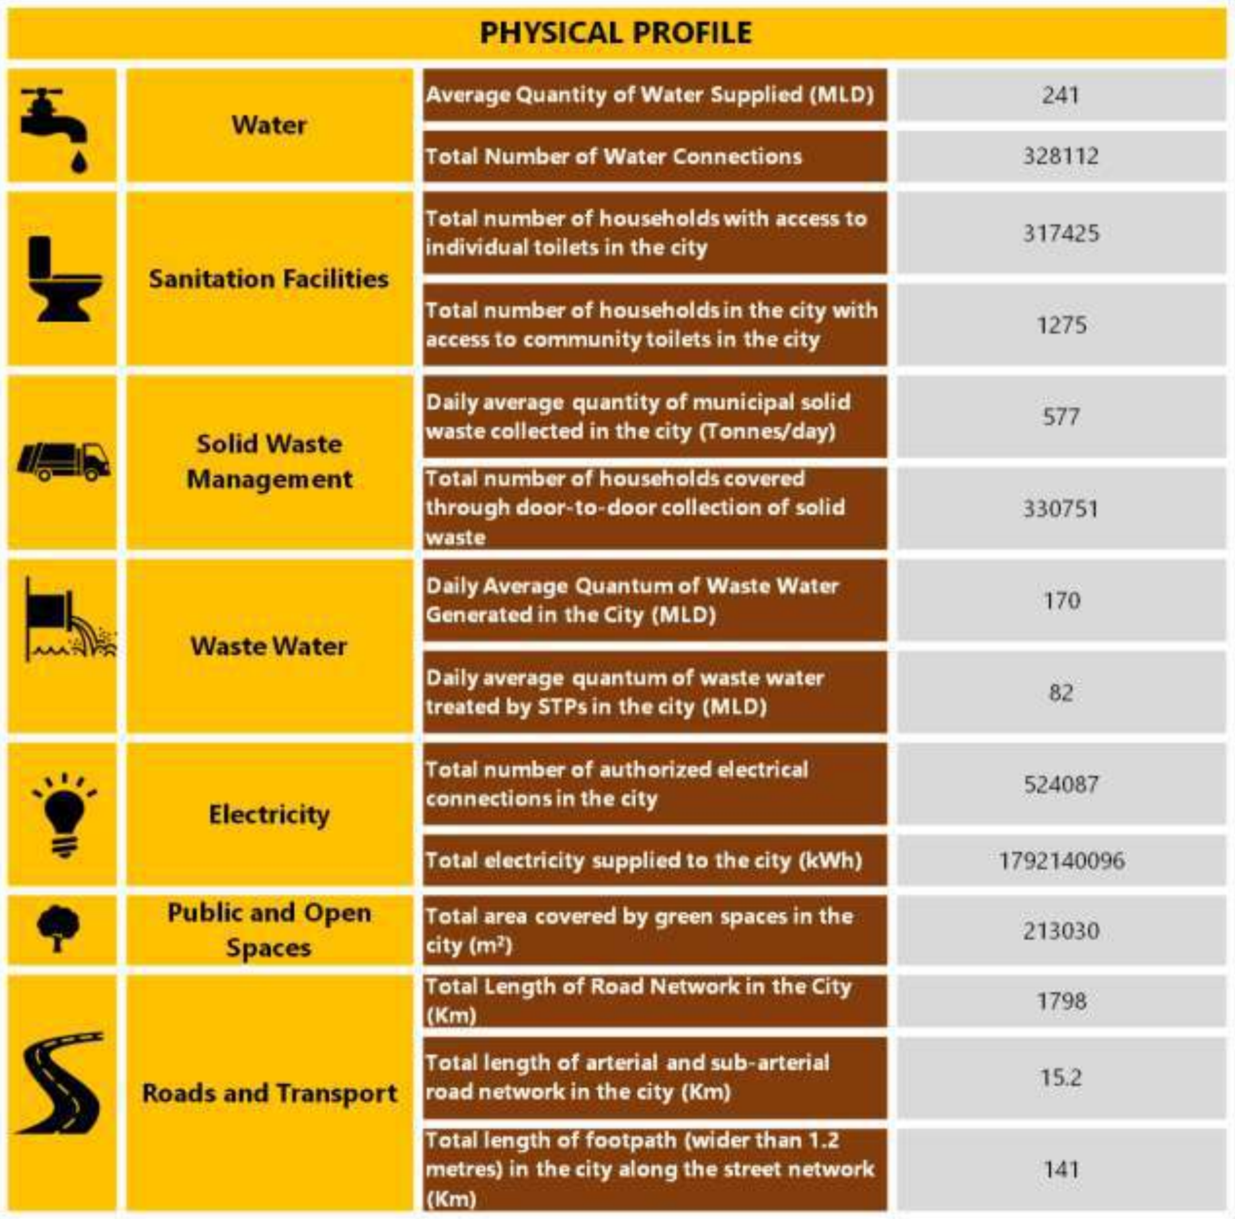
Total Population	1563345
Total Number of Households	382663

SOCIAL PROFILE

Education	**Total Number of Schools**	565
	Total Enrolment (Class 1 to 5)	111669
Health	**Total Number of In-patient Beds**	5788
	Total Health Workforce	3476
Safety and Security	**Total Strength of Police Force**	1908
	Total Number of CCTV Cameras	1548
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	953640
Total Number of Industries	15261
Total Number of Commercial Enterprises	94411
Total Number of Hotels	85
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	95422
Total VAT Collection in FY 2016-17 (INR Lakhs)	90286



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	241
	Total Number of Water Connections	328112
Sanitation Facilities	Total number of households with access to individual toilets in the city	317425
	Total number of households in the city with access to community toilets in the city	1275
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	577
	Total number of households covered through door-to-door collection of solid waste	330751
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	170
	Daily average quantum of waste water treated by STPs in the city (MLD)	82
Electricity	Total number of authorized electrical connections in the city	524087
	Total electricity supplied to the city (kWh)	1792140096
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	213030
Roads and Transport	Total Length of Road Network in the City (Km)	1798
	Total length of arterial and sub-arterial road network in the city (Km)	15.2
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	141

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

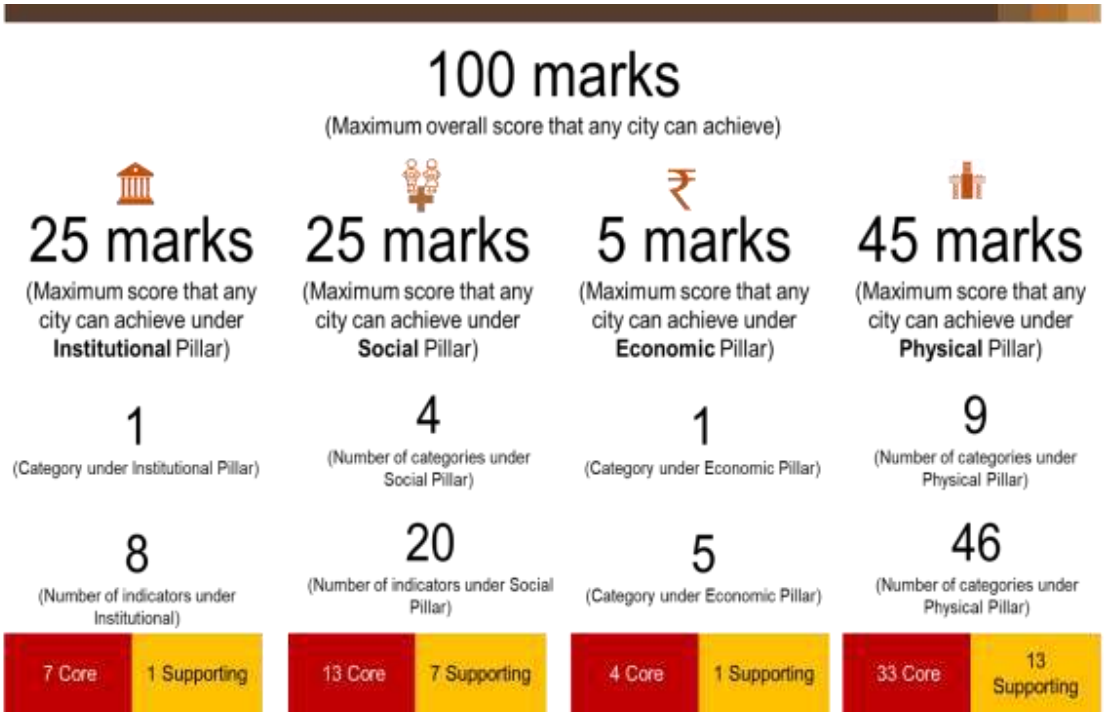
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core | 1 Supporting

25 marks
(Maximum score that any city can achieve under **Social** Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core | 7 Supporting

5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
1
(Category under Economic Pillar)
5
(Category under Economic Pillar)
4 Core | 1 Supporting

45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
9
(Number of categories under Physical Pillar)
46
(Number of categories under Physical Pillar)
33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account
Urban Local Body	For Park and Recreation Related Questions	Park and recreation
Urban Local Body	For Water Supply and Drainage related questions	Drainage department
Urban Local Body	For Heritage sites related data	-
Urban Local Body	For Ecological sites related data	-
Urban Local Body	For Housing related data	-
Urban Local Body	For Building plan related data	Town development
Urban Local Body	For Roads related data	
Urban Local Body	For Solid waste management related data	Solid waste management
Urban Local Body	For IT services related data	
Urban Local Body	For Vendor committee related data	
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Water department
Development Authority	Building Infrastructure	
	Construction planning	
	Green Building	

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	
	Universal Design Principle	
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Pgvcl
State Disaster management authority		
State Education Department		
State Health Department	Health care professionals	Health department
	Citizen Services	
	Disease Prevalence	
	Health Infrastructure	
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		
Town and Country Planning Department	Land Use	
Traffic and Police Department		
Transport Authorities	Buses	
	Registered Vehicles	R.T.O
	Sub urban rail transport	Railway department
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 25 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	3
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	0
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	1
Transport Authority	1
Disaster Management	0
Urban Local Body	14
Total	25*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

🟦 6. LA - Passenger Information Systems
🟪 7. LA - Street Vendors
🟪 8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	56.12%
Identity & Culture	44%
Education	85%
Health	93%
Safety & Security	61%
Economy & Employment	25%
Housing & Inclusiveness	2%
Public Open Spaces	1%
Mixed Land Use & Compactness	37%
Power Supply	53%
Transport & Mobility	40%
Assured Water Supply	83%
Waste Water Management	72%
Solid Waste Management	68%
Reduced Pollution	86%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	possible in the short window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

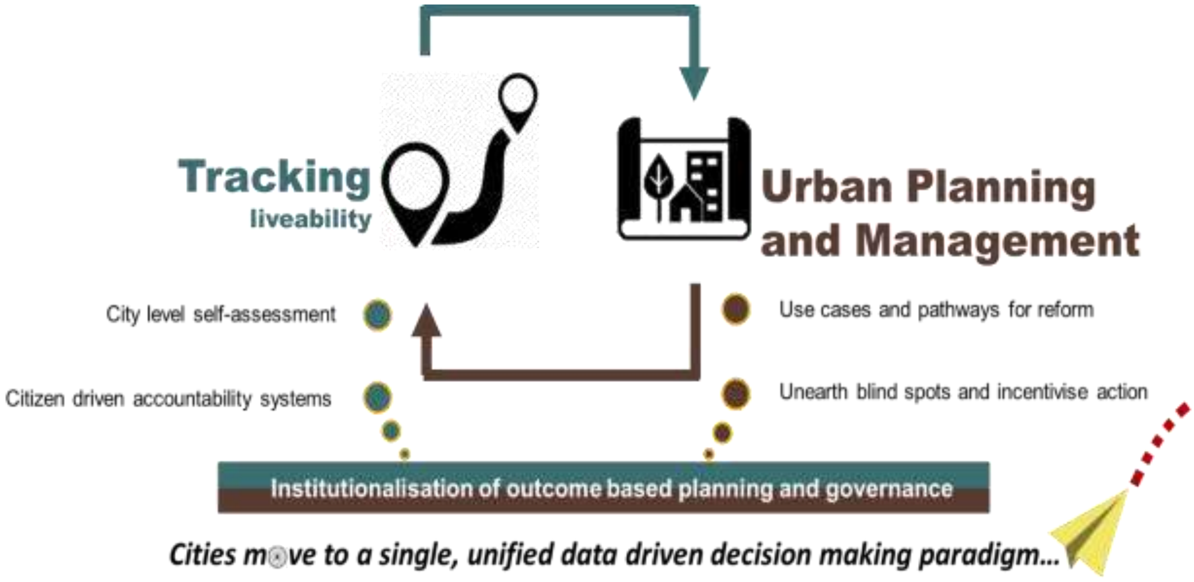
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

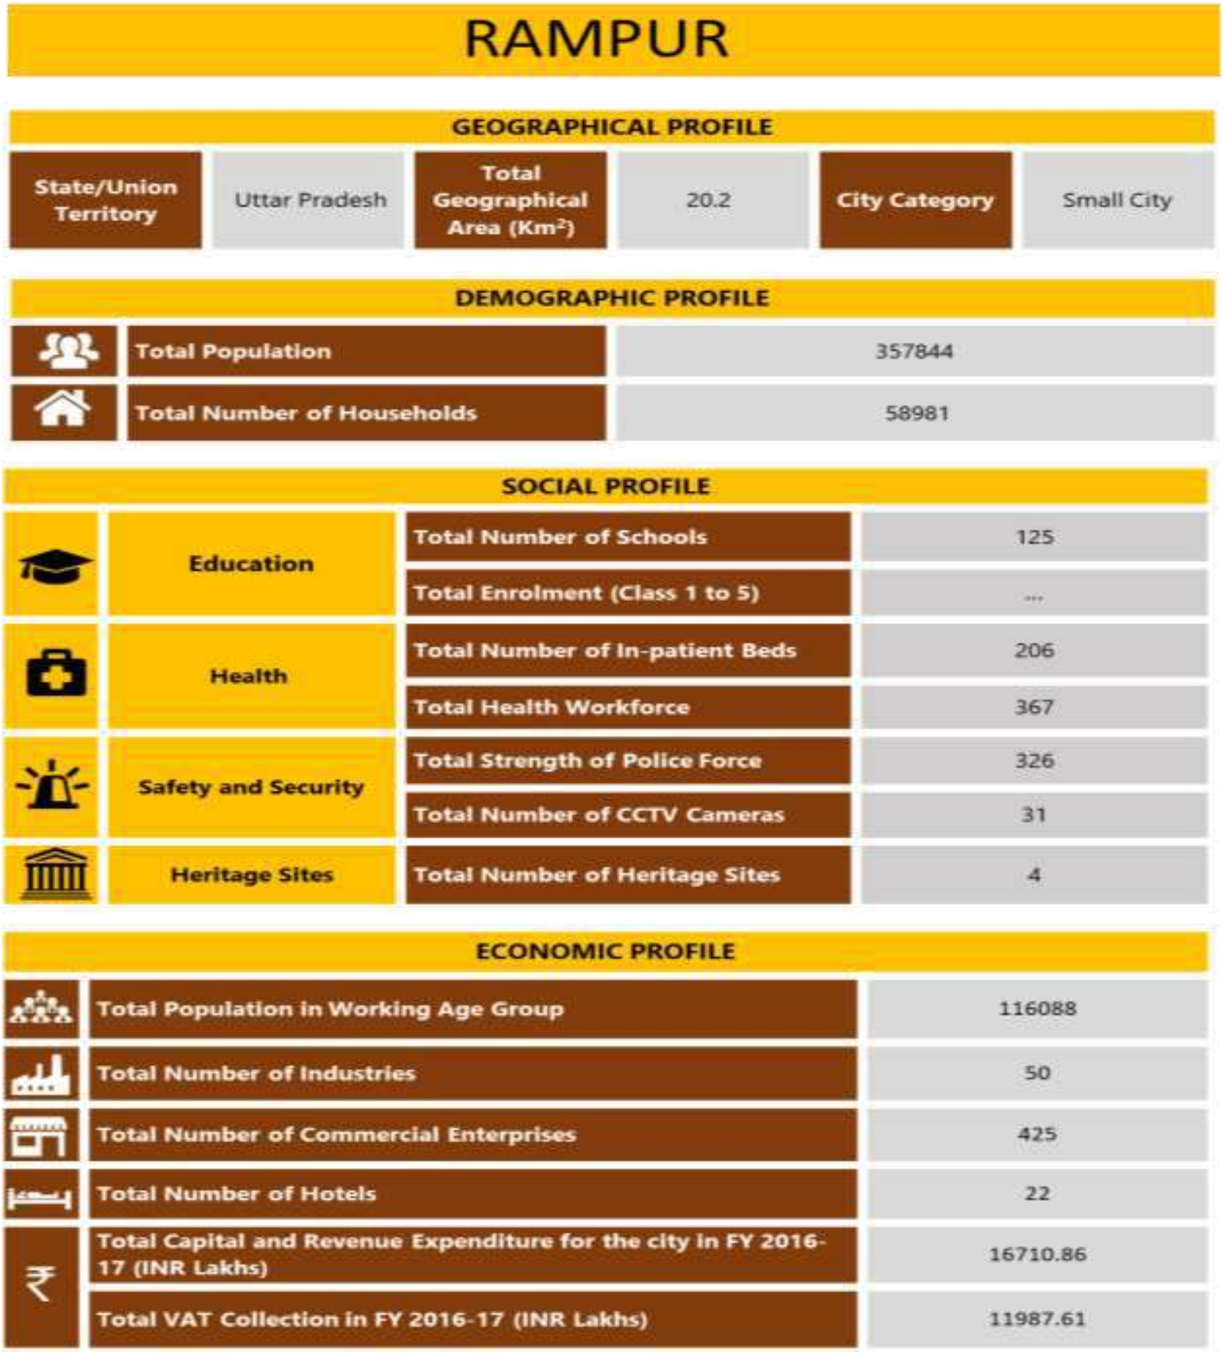


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



RAMPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	Total Geographical Area (Km^2)	20.2	City Category	Small City

DEMOGRAPHIC PROFILE

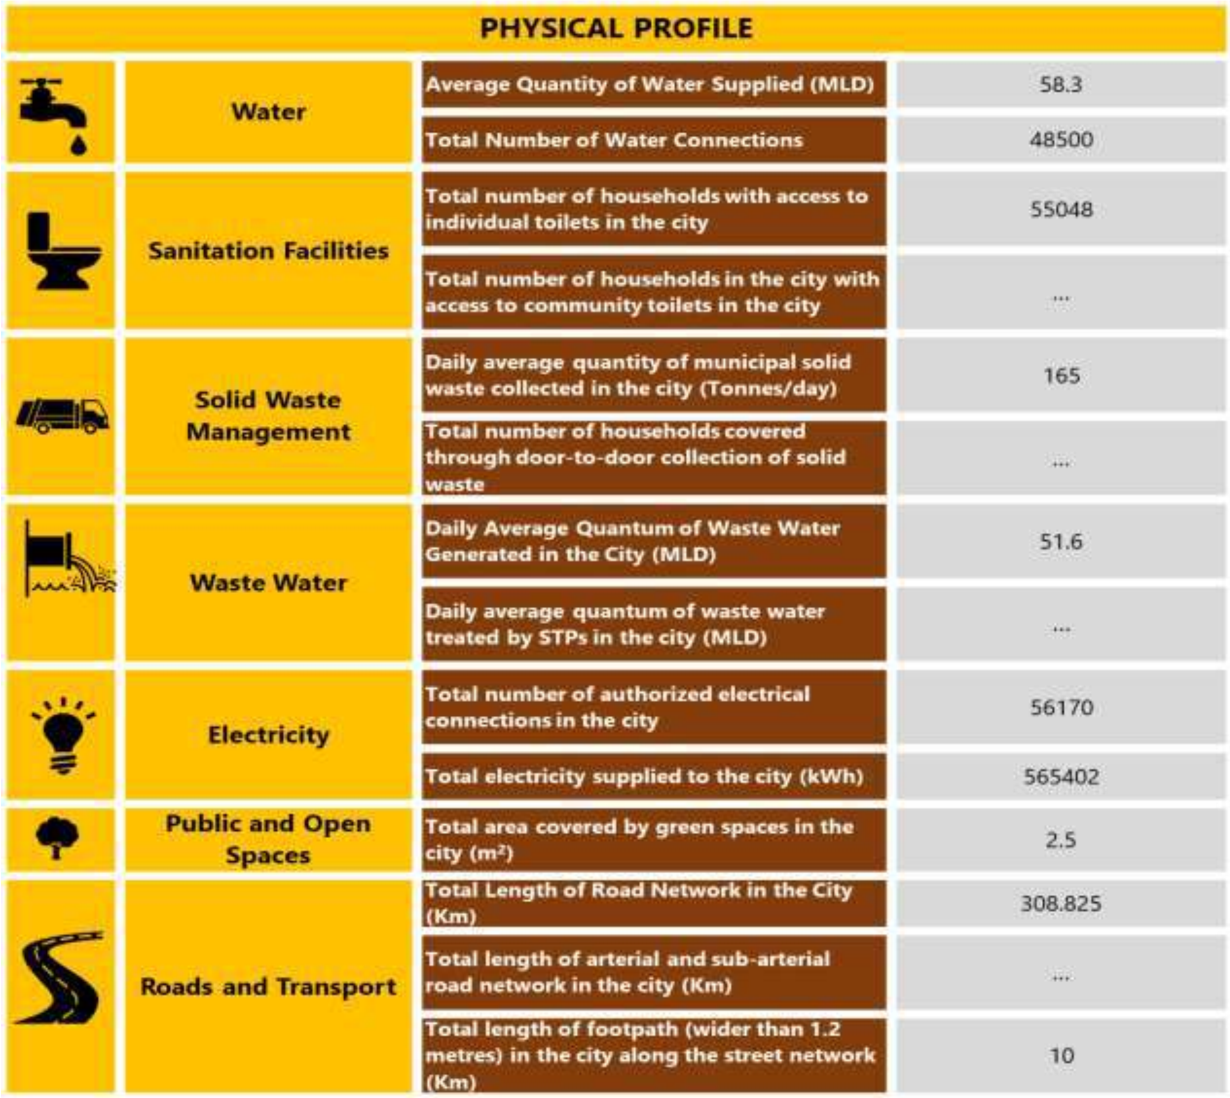
Total Population	357844
Total Number of Households	58981

SOCIAL PROFILE

Education	Total Number of Schools	125
	Total Enrolment (Class 1 to 5)	...
Health	Total Number of In-patient Beds	206
	Total Health Workforce	367
Safety and Security	Total Strength of Police Force	326
	Total Number of CCTV Cameras	31
Heritage Sites	Total Number of Heritage Sites	4

ECONOMIC PROFILE

Total Population in Working Age Group	116088
Total Number of Industries	50
Total Number of Commercial Enterprises	425
Total Number of Hotels	22
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	16710.86
Total VAT Collection in FY 2016-17 (INR Lakhs)	11987.61



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	58.3
	Total Number of Water Connections	48500
Sanitation Facilities	Total number of households with access to individual toilets in the city	55048
	Total number of households in the city with access to community toilets in the city	…
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	165
	Total number of households covered through door-to-door collection of solid waste	…
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	51.6
	Daily average quantum of waste water treated by STPs in the city (MLD)	…
Electricity	Total number of authorized electrical connections in the city	56170
	Total electricity supplied to the city (kWh)	565402
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	2.5
Roads and Transport	Total Length of Road Network in the City (Km)	308.825
	Total length of arterial and sub-arterial road network in the city (Km)	…
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	10

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies

Pillars of Comprehensive Development	Category	Indicators
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita

Pillars of Comprehensive Development	Category	Indicators
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced	15.1 Concentration of SO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
	Pollution	15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

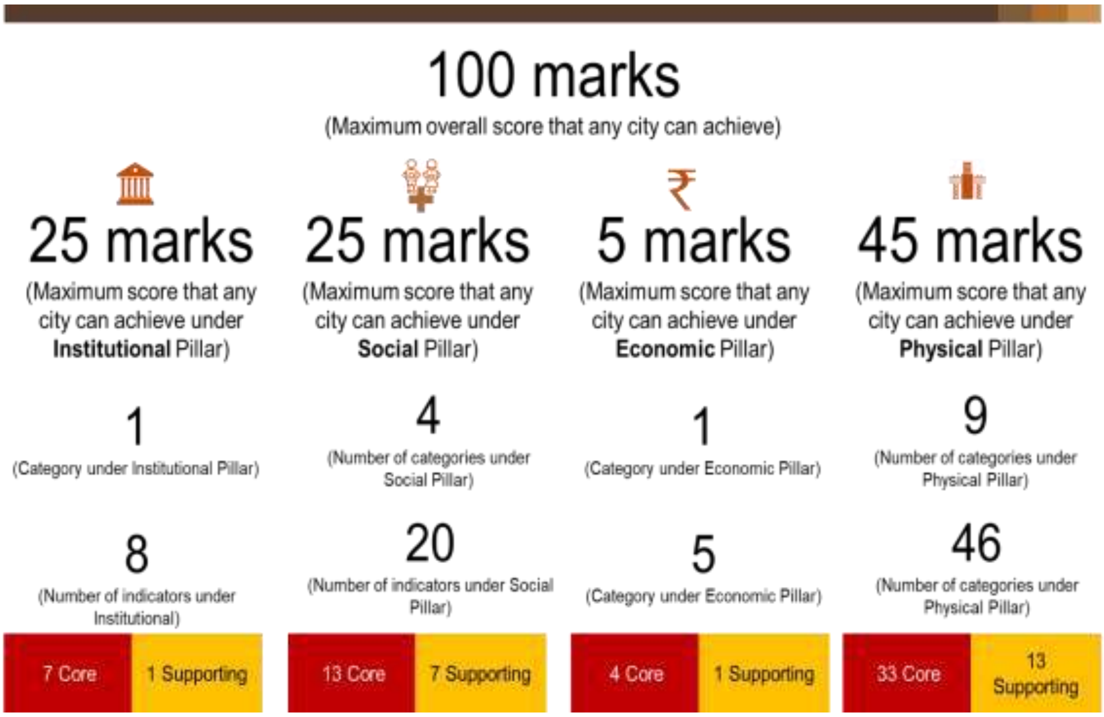
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department Nagar Palika Parishad Rampur
Urban Local Body	For Park and Recreation Related Questions	Civil department Nagar Palika Parishad Rampur
Urban Local Body	For Water Supply and Drainage related questions	Jalkal vibhag Nagar Palika Parishad Rampur
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB
Urban Local Body	For Ecological sites related data	Civil Department Rampur
Urban Local Body	For Housing related data	Moradabad Development Authority / properties tax department Nagar Palika Parishad Rampur
Urban Local Body	For Building plan related data	Rampur Development Authority Rampur
Urban Local Body	For Roads related data	Public Works Department / civil department rampur
Urban Local Body	For Solid waste management related data	Health Department Nagar Palika Parishad Rampur
Urban Local Body	For IT services related data	IT department (main office) Nagar palika parishad Rampur
Urban Local Body	For Vendor committee related data	Tex department ULB Rampur
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District urban development Agency Rampur
Central / state	Water Quality, Air	Uttar Pradesh pollution Control Board

Designated data owners	Subcategories	Data owners at city level
Pollution control Board	Quality, Noise Quality	Moradabad
Development Authority	Building Infrastructure	Rampur development Authority Rampur
	Construction planning	Rampur development Authority Rampur
	Green Building	Rampur development Authority Rampur
	Rain water harvesting	Rampur development Authority Rampur
	Universal Design Principle	Rampur development Authority Rampur
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttar Pradesh Power Corporation Ltd Rampur
State Disaster management authority		State Disaster Management Rampur [in UP ADM (FR]
State Education Department		Basic Siksha Adhikari/district inspector of school Rampur (DIOS)
State Health Department	Health care professionals	UP State Health Department Rampur (CMO)
	Citizen Services	UP State Health Department Rampur (CMO)
	Disease Prevalence	UP State Health Department Rampur (CMO)
	Health Infrastructure	UP State Health Department Rampur (CMO)
State Renewable Energy Development Agency	Renewable Energy	State Renewable Energy Develop. Agency(NEDA)
State Sales / Commercial Taxes Department		Commercial Taxes Department Rampur
Town and Country Planning Department	Land Use	Town and Country Planning Department Moradabad
Traffic and Police Department		Traffic police, Civil police & Grand Railway police Rampur
Transport Authorities	Buses	Uttar Pradesh State transport Corporation & Regional Transport Office Rampur
	Registered Vehicles	Regional Transport Office Rampur
	Sub urban rail transport	N A
	Mono Rail Authority	N A
	Tramways	N A
	Marine Transport Authority	N A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 45 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

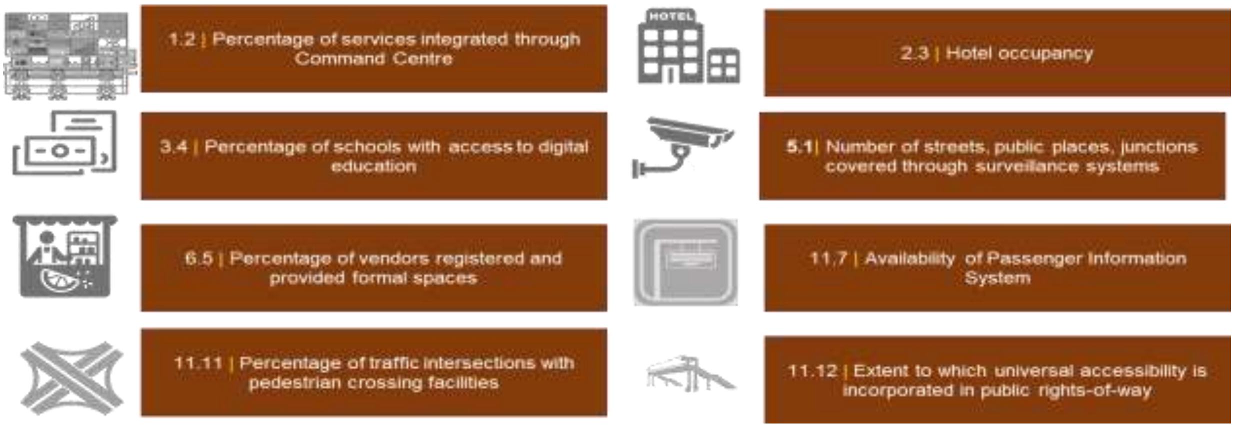
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**3**
Traffic and Police Department	**1**
Development Authority	**1**
Pollution Control Board	**1**
State Renewable Energy Department	**3**
Town and Country Planning	**1**
State Health Department	**3**
Transport Authority	**1**
Disaster Management	**1**
Urban Local Body	**28**
Total	**45***

4.4 Data Verification

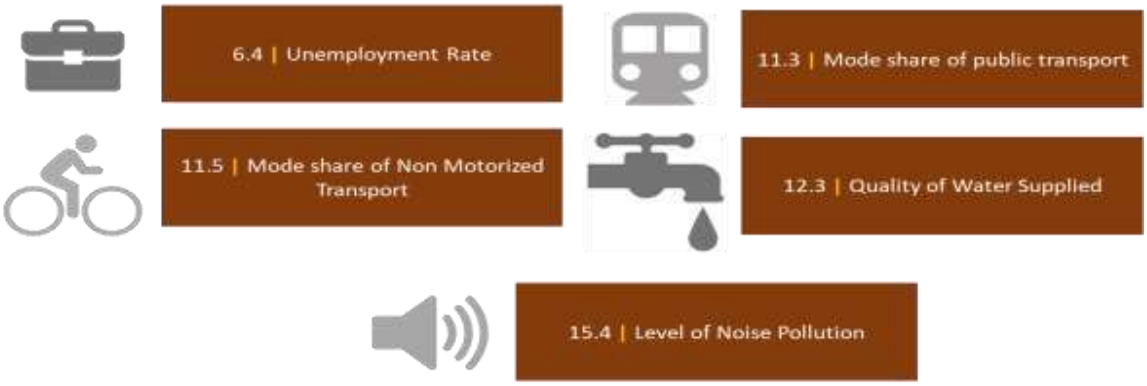
A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- 5.1 | Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.



- 6.4 | Unemployment Rate
- 11.3 | Mode share of public transport
- 11.5 | Mode share of Non Motorized Transport
- 12.3 | Quality of Water Supplied
- 15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: category wise scores

Categories	Scores in Percentage
Governance	44.26%
Identity & Culture	11%
Education	0%
Health	58%
Safety & Security	63%
Economy & Employment	58%
Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	57%
Transport & Mobility	27%
Assured Water Supply	40%
Waste Water Management	19%
Solid Waste Management	33%
Reduced Pollution	0%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

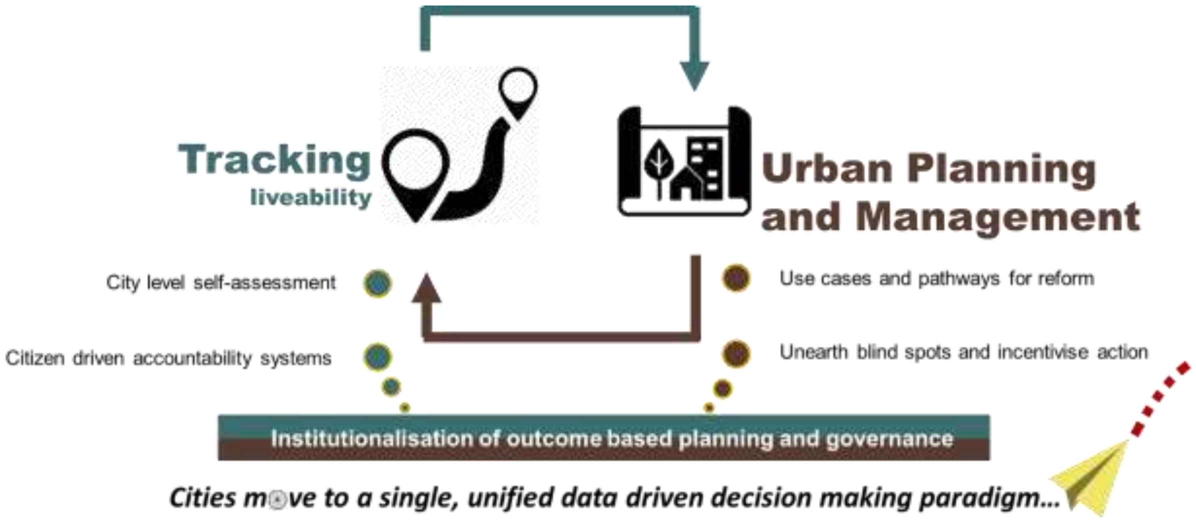
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

RANCHI

GEOGRAPHICAL PROFILE

State/Union Territory	Jharkhand	**Total Geographical Area (Km^2)**	175	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1073427
Total Number of Households	239239

SOCIAL PROFILE

Education	**Total Number of Schools**	319
	Total Enrolment (Class 1 to 5)	80333
Health	**Total Number of In-patient Beds**	43
	Total Health Workforce	4422
Safety and Security	**Total Strength of Police Force**	4254
	Total Number of CCTV Cameras	180
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	558688
Total Number of Industries	7
Total Number of Commercial Enterprises	26000
Total Number of Hotels	340
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	18593
Total VAT Collection in FY 2016-17 (INR Lakhs)	513159

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	217
	Total Number of Water Connection	43098
Sanitation Facilities	Total number of households with access to individual toilets in the city	163229
	Total number of households in the city with access to community toilets in the city	1875
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	160
	Total number of households covered through door-to-door collection of solid waste	123863
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	5
	Daily average quantum of waste water treated by STPs in the city (MLD)	0
Electricity	Total number of authorized electrical connections in the city	297409
	Total electricity supplied to the city (kWh)	1084552698
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	1011980000
Roads and Transport	Total Length of Road Network in the City (Km)	143
	Total length of arterial and sub-arterial road network in the city (Km)	55
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	171

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities

Pillars of Comprehensive Development	Category	Indicators
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal

Pillars of Comprehensive Development	Category	Indicators
		spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle

Pillars of Comprehensive Development	Category	Indicators
		tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste	14.1 Household level coverage of municipal solid waste

Pillars of Comprehensive Development	Category	Indicators
	Management	collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

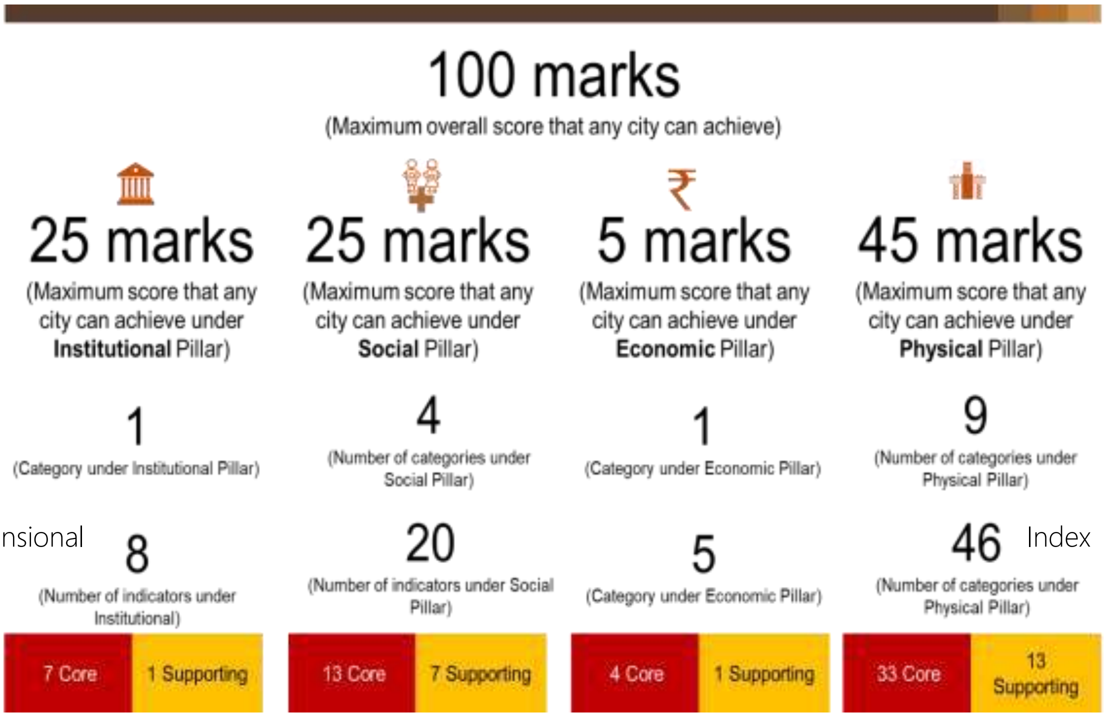
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the

questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Ranchi Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Ranchi Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Ranchi Municipal Corporation
Urban Local Body	For Heritage sites related data	Ranchi Municipal Corporation
Urban Local Body	For Ecological sites related data	Ranchi Municipal Corporation
Urban Local Body	For Housing related data	Ranchi Municipal Corporation
Urban Local Body	For Building plan related data	Ranchi Municipal Corporation
Urban Local Body	For Roads related data	Ranchi Municipal Corporation
Urban Local Body	For Solid waste management related data	Ranchi Municipal Corporation
Urban Local Body	For IT services related data	Ranchi Municipal Corporation
Urban Local Body	For Vendor committee related data	Ranchi Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Tourism department, Excise and taxes department, architecture department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	JharkhandState Pollution Control Board
Development Authority	Building Infrastructure	Greater Ranchi Development Authority
	Construction planning	Greater Ranchi Development Authority
	Green Building	Greater Ranchi Development Authority
	Rain water harvesting	Greater Ranchi Development Authority
	Universal Design Principle	Greater Ranchi Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tripura State Electricity Corporation Limited
State Disaster management authority		District Disaster management Office, Ranchi
State Education Department		District Education Department, Ranchi

Designated data owners	Subcategories	Data owners at city level
State Health Department	Health care professionals	Civil Surgeon, Ranchi
	Citizen Services	Civil Surgeon, Ranchi
	Disease Prevalence	Civil Surgeon, Ranchi
	Health Infrastructure	Civil Surgeon, Ranchi
State Renewable Energy Development Agency		Jharkhand Renewable Energy Development Agency, Ranchi
State Sales / Commercial Taxes Department		Commercial Taxes department, Ranchi
Town and Country Planning Department	Land Use	Town Planning Department, Ranchi
Traffic and Police Department		Office of Commissioner of Police, Ranchi
Transport Authorities	Buses	District Transport Office, Ranchi
	Registered Vehicles	District Transport Office, Ranchi
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 09 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

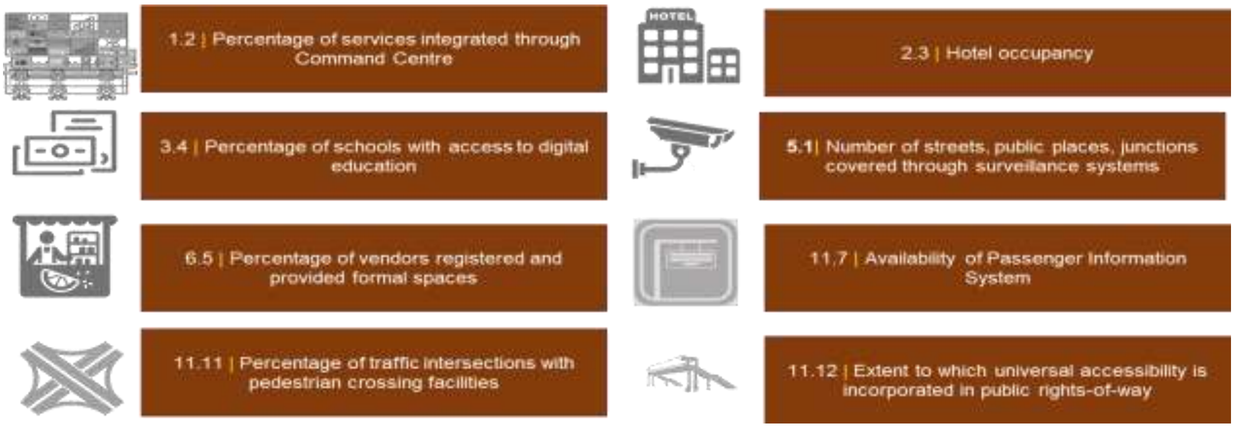
Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	0
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	1
Town and Country Planning	0
State Health Department	1
Transport Authority	0
Disaster Management	0
Urban Local Body	6
Total	09*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	71.46%
Identity & Culture	49%
Education	68%
Health	71%
Safety & Security	47%
Economy & Employment	16%
Housing & Inclusiveness	26%
Public Open Spaces	7%
Mixed Land Use & Compactness	11%
Power Supply	62%
Transport & Mobility	22%
Assured Water Supply	62%
Waste Water Management	40%
Solid Waste Management	30%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

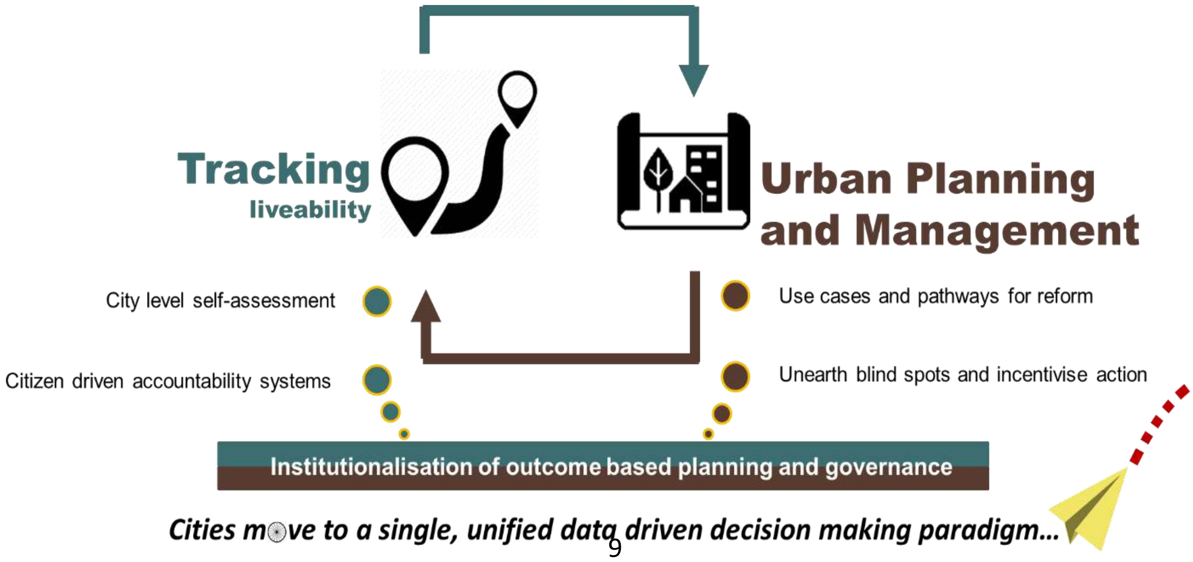
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

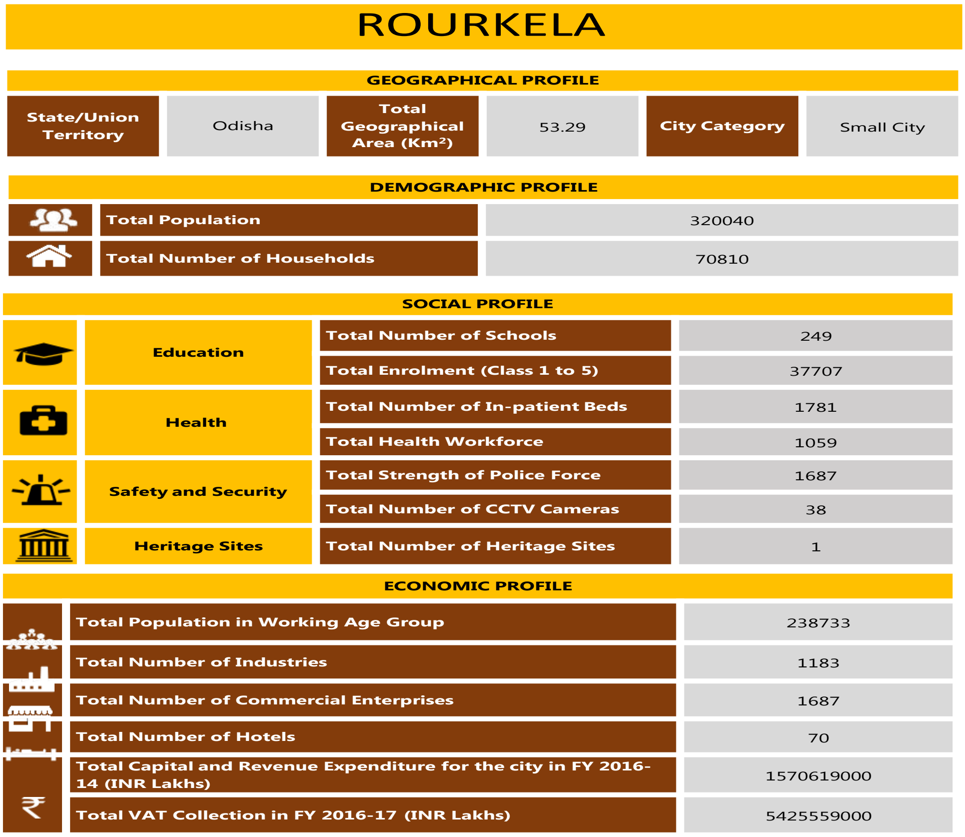


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



ROURKELA

GEOGRAPHICAL PROFILE

State/Union Territory	Odisha	Total Geographical Area (Km²)	53.29	City Category	Small City

DEMOGRAPHIC PROFILE

Total Population	320040
Total Number of Households	70810

SOCIAL PROFILE

Education	Total Number of Schools	249
	Total Enrolment (Class 1 to 5)	37707
Health	Total Number of In-patient Beds	1781
	Total Health Workforce	1059
Safety and Security	Total Strength of Police Force	1687
	Total Number of CCTV Cameras	38
Heritage Sites	Total Number of Heritage Sites	1

ECONOMIC PROFILE

Total Population in Working Age Group	238733
Total Number of Industries	1183
Total Number of Commercial Enterprises	1687
Total Number of Hotels	70
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	1570619000
Total VAT Collection in FY 2016-17 (INR Lakhs)	5425559000

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	52.6
	Total Number of Water Connection	23895
Sanitation Facilities	Total number of households with access to individual toilets in the city	57534
	Total number of households in the city with access to community toilets in the city	2800
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	10200
	Total number of households covered through door-to-door collection of solid waste	61413
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	48
	Daily average quantum of waste water treated by STPs in the city (MLD)	0
Electricity	Total number of authorized electrical connections in the city	79629
	Total electricity supplied to the city (kWh)	288780000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	787540.7
Roads and Transport	Total Length of Road Network in the City (Km)	524.47
	Total length of arterial and sub-arterial road network in the city (Km)	78.268
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	30

3.Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education

Pillars of Comprehensive Development	Category	Indicators
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections

Pillars of Comprehensive Development	Category	Indicators
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

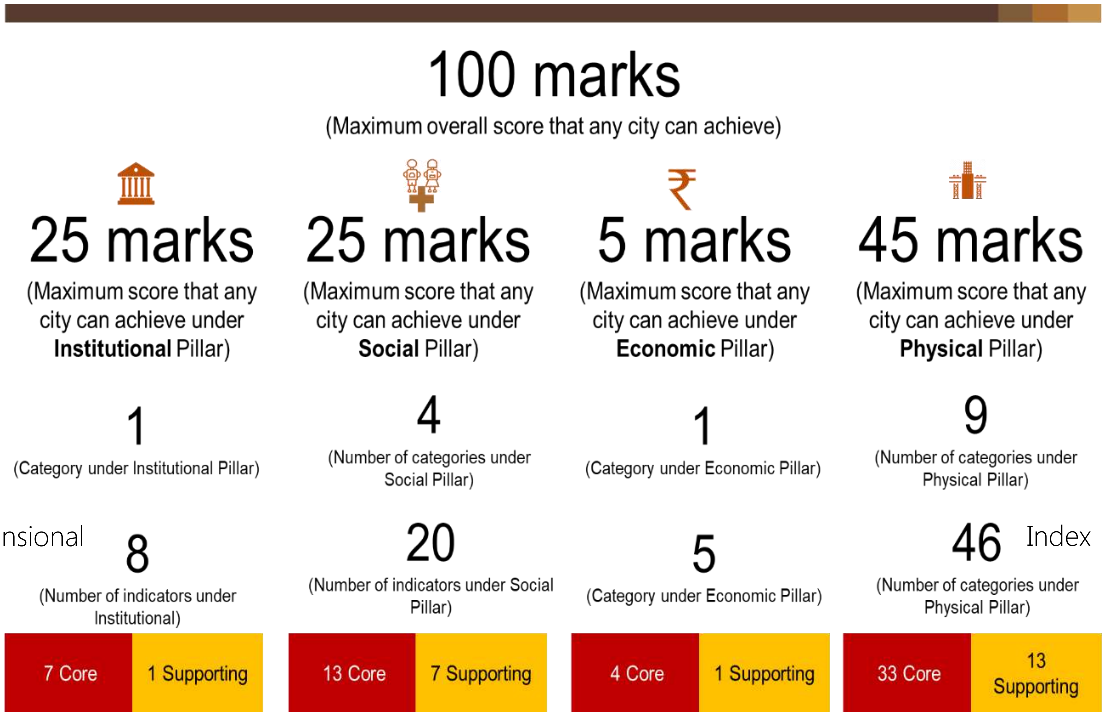
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Rourkela Municipal Corporation Revenue Deptt., Sub-Collector Office
Urban Local Body	For Park and Recreation Related Questions	Rourkela Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Rourkela Municipal Corporation
Urban Local Body	For Heritage sites related data	District Tourist Office, Dept. of Tourism Rourkela Municipal Corporation
Urban Local Body	For Ecological sites related data	Rourkela Municipal Corporation
Urban Local Body	For Housing related data	Rourkela Municipal Corporation Rourkela Development Authority
Urban Local Body	For Building plan related data	Rourkela Municipal Corporation Rourkela Development Authority
Urban Local Body	For Roads related data	Rourkela Municipal Corporation Road & Building Superintendent Engineer
Urban Local Body	For Solid waste management related data	Rourkela Municipal Corporation
Urban Local Body	For IT services related data	Rourkela Municipal Corporation
Urban Local Body	For Vendor committee related data	Rourkela Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Public Health Officer, Odisha State Pollution Control Board
Development Authority	Building Infrastructure	Rourkela Municipal Corporation RDA/Smart City
	Construction planning	Rourkela Municipal Corporation RDA/Smart City
	Green Building	Rourkela Municipal Corporation RDA/Smart City
	Rain water harvesting	Department of Water Resources RDA/Smart City

Designated data owners	Subcategories	Data owners at city level
	Universal Design Principle	Rourkela Municipal Corporation RDA/Smart City
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	WESCO, Rourkela
State Disaster management authority		Odisha State Disaster Management Authority
State Education Department		BEO Office, Rourkela
State Health Department	Health care professionals	IGH, SAIL, Rourkela Steel Plant RGH, Rourkela
	Citizen Services	IGH, SAIL, Rourkela Steel Plant NUHM RGH, Rourkela
	Disease Prevalence	IGH, SAIL, Rourkela Steel Plant NUHM RGH, Rourkela
	Health Infrastructure	IGH, SAIL, Rourkela Steel Plant RGH, Rourkela
State Renewable Energy Development Agency		Odisha Renewable Energy Development Agency
State Sales / Commercial Taxes Department		Commercial Tax Department, Rourkela
Town and Country Planning Department	Land Use	SAIL, Rourkela Steel PlantRDA/Smart City
Traffic and Police Department		Office of the Superintendent of Police, Rourkela
Transport Authorities	Buses	Road Transport Office
	Registered Vehicles	Road Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 06 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping

of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	0
Traffic and Police Department	0
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	0
Transport Authority	1
Disaster Management	0
Urban Local Body	1
Total	6*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	26.56%
Identity & Culture	21%
Education	91%
Health	99%
Safety & Security	58%
Economy & Employment	15%
Housing & Inclusiveness	8%
Public Open Spaces	13%
Mixed Land Use & Compactness	0%
Power Supply	52%
Transport & Mobility	40%
Assured Water Supply	56%
Waste Water Management	38%
Solid Waste Management	57%
Reduced Pollution	65%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought

various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.

#	Challenges	Proposed Solutions
	window.	
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

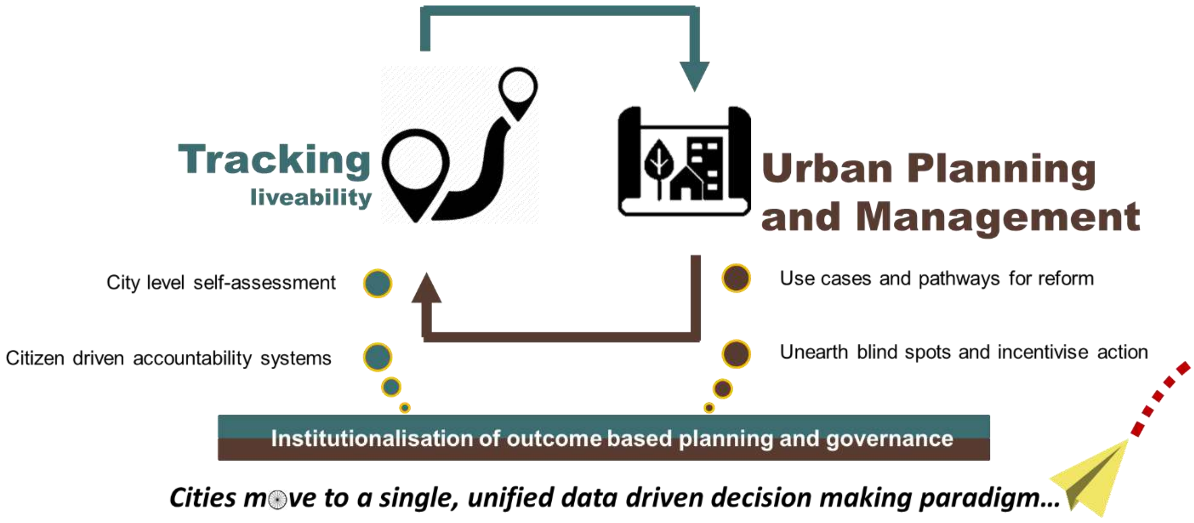
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



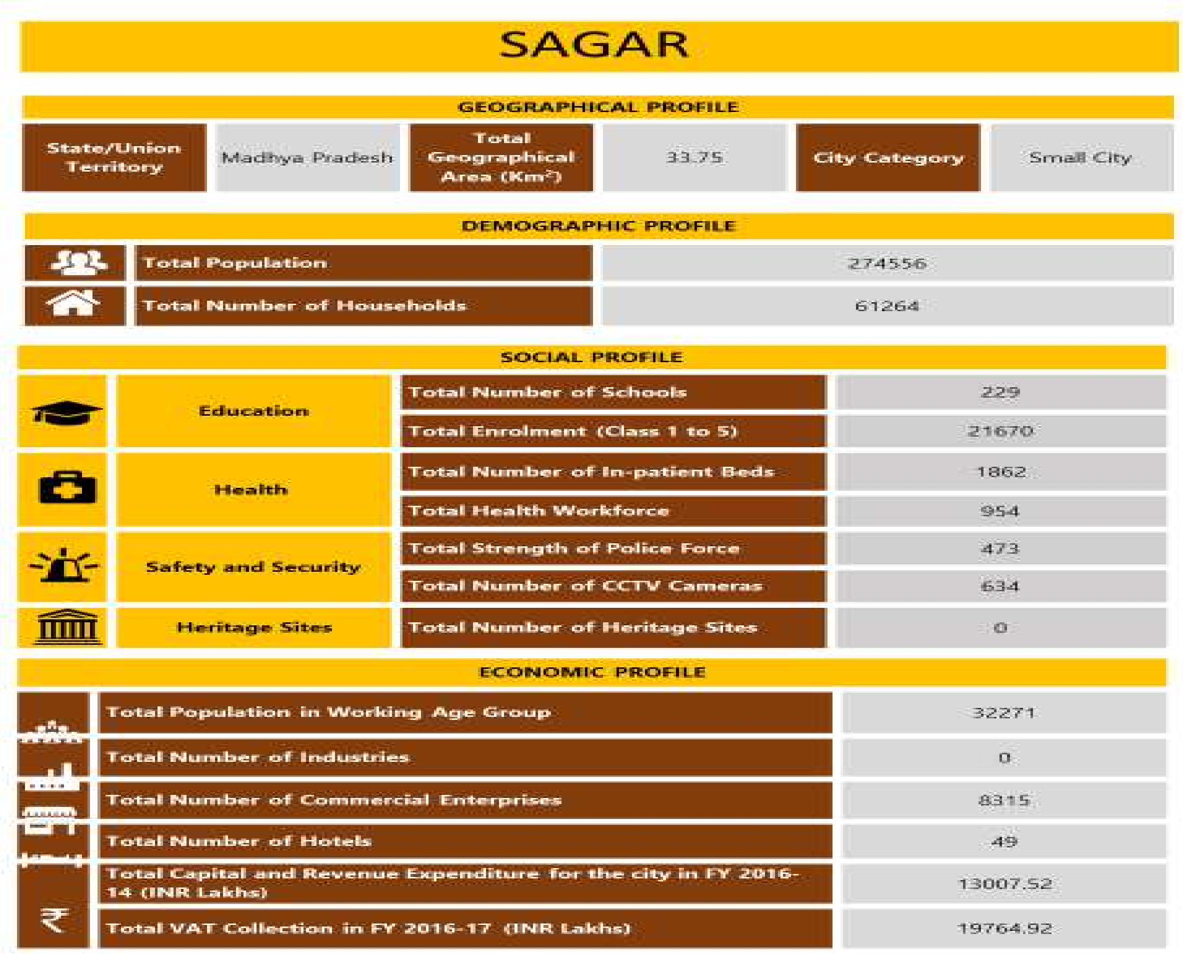
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SAGAR

GEOGRAPHICAL PROFILE

State/Union Territory	Madhya Pradesh	Total Geographical Area (Km²)	33.75	City Category	Small City

DEMOGRAPHIC PROFILE

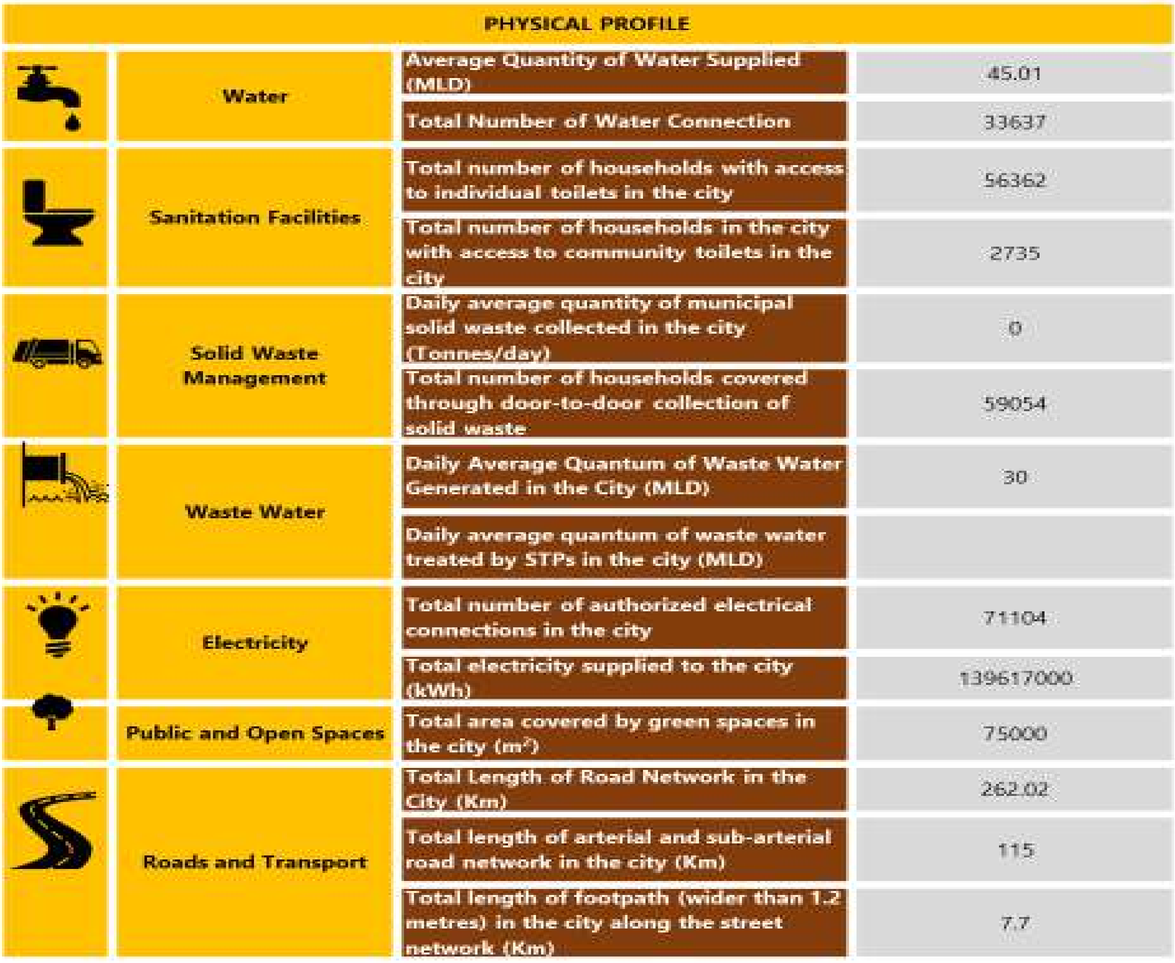
Total Population	274556
Total Number of Households	61264

SOCIAL PROFILE

Education	Total Number of Schools	229
	Total Enrolment (Class 1 to 5)	21670
Health	Total Number of In-patient Beds	1862
	Total Health Workforce	954
Safety and Security	Total Strength of Police Force	473
	Total Number of CCTV Cameras	634
Heritage Sites	Total Number of Heritage Sites	0

ECONOMIC PROFILE

Total Population in Working Age Group	32271
Total Number of Industries	0
Total Number of Commercial Enterprises	8315
Total Number of Hotels	49
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	13007.52
Total VAT Collection in FY 2016-17 (INR Lakhs)	19764.92



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	45.01
	Total Number of Water Connection	33637
Sanitation Facilities	Total number of households with access to individual toilets in the city	56362
	Total number of households in the city with access to community toilets in the city	2735
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	0
	Total number of households covered through door-to-door collection of solid waste	59054
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	30
	Daily average quantum of waste water treated by STPs in the city (MLD)	
Electricity	Total number of authorized electrical connections in the city	71104
	Total electricity supplied to the city (kWh)	139617000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	75000
Roads and Transport	Total Length of Road Network in the City (Km)	262.02
	Total length of arterial and sub-arterial road network in the city (Km)	115
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	7.7

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	2. Identity and Culture	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education

Pillars of Comprehensive Development	Category	Indicators
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	7. Housing and Inclusiveness	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places

Pillars of Comprehensive Development	Category	Indicators
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization

Pillars of Comprehensive Development	Category	Indicators
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution

Pillars of Comprehensive Development	Category	Indicators
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

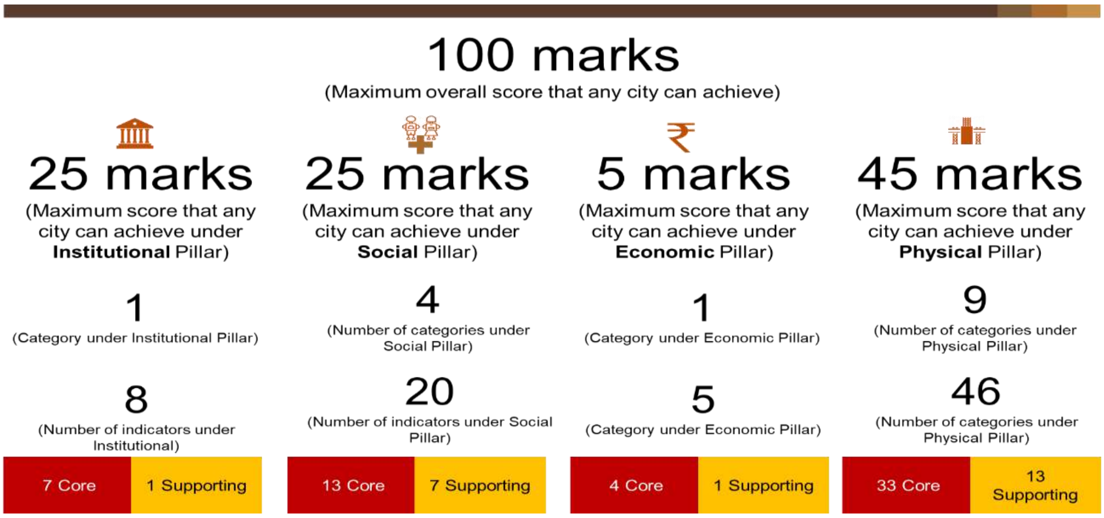
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	**25 marks** (Maximum score that any city can achieve under **Social** Pillar)	**5 marks** (Maximum score that any city can achieve under **Economic** Pillar)	**45 marks** (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Accounts	Accounts Department, Sagar Municipal Corporation
	Park and Recreation	Sagar Municipal Corporation
	Water Supply and Drainage	Water Supply department, Sagar Municipal Corporation
	Heritage sites	Sagar Municipal Corporation
	Ecological sites	Sagar Municipal Corporation
	Housing	Housing section, Sagar Municipal Corporation
	Building plan	Sagar Municipal Corporation
	Roads	Lokakram Sakha, Sagar Municipal Corporation
	Solid waste management	Sagar Municipal Corporation
	IT services	IT Section, Sagar Municipal

Designated data owners	Sub categories	Data owners at city level
		Corporation
	Vendor committee	Bazar Sakha, Sagar Municipal Corporation
	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Madhya Pradesh Pollution Control Board
Development Authority	Building Infrastructure	MP Housing and Infrastructure development board
	Construction planning	MP Housing and Infrastructure development board
	Green Building	MP Housing and Infrastructure development board
	Rain water harvesting	MP Housing and Infrastructure development board
	Universal Design Principle	MP Housing and Infrastructure development board
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Madhya Pradesh Poorv Kshetra Vidyut Vitaran Company limited
State Disaster management authority		District Disaster management Office
State Education Department		District Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		Madhya Pradesh New and Renewable energy Department
State Sales / Commercial Taxes Department		Department of Commercial Taxes
Town and Country Planning Department	Land Use	Town and country planning
Traffic and Police Department		Traffic and Police Department, Sagar
	Buses	Regional Transport Office

Designated data owners	Sub categories	Data owners at city level
Transport Authorities	Registered Vehicles	Madhya Pradesh Transport Department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 92 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	1
DISCOM/Electricity Department	3
Traffic and Police Department	5
Development Authority	1
Pollution Control Board	3
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	2
Transport Authority	1
Disaster Management	0
Urban Local Body	72
Total	92

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	56.51%
Identity & Culture	27%
Education	68%
Health	99%
Safety & Security	55%
Economy & Employment	30%
Housing & Inclusiveness	19%
Public Open Spaces	1%
Mixed Land Use & Compactness	0%
Power Supply	41%
Transport & Mobility	13%
Assured Water Supply	77%
Waste Water Management	45%
Solid Waste Management	33%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

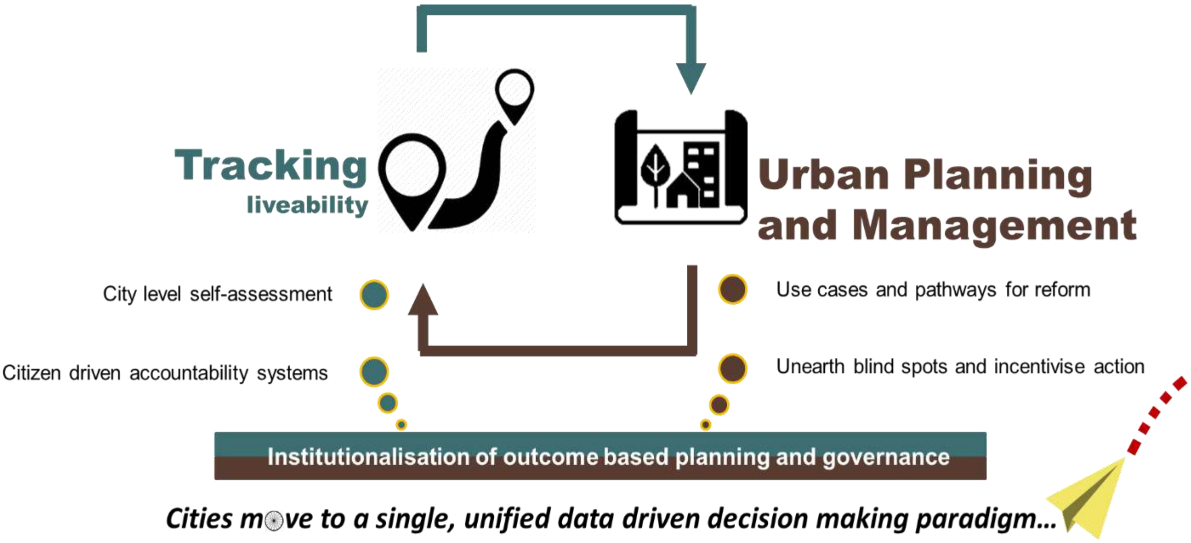
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



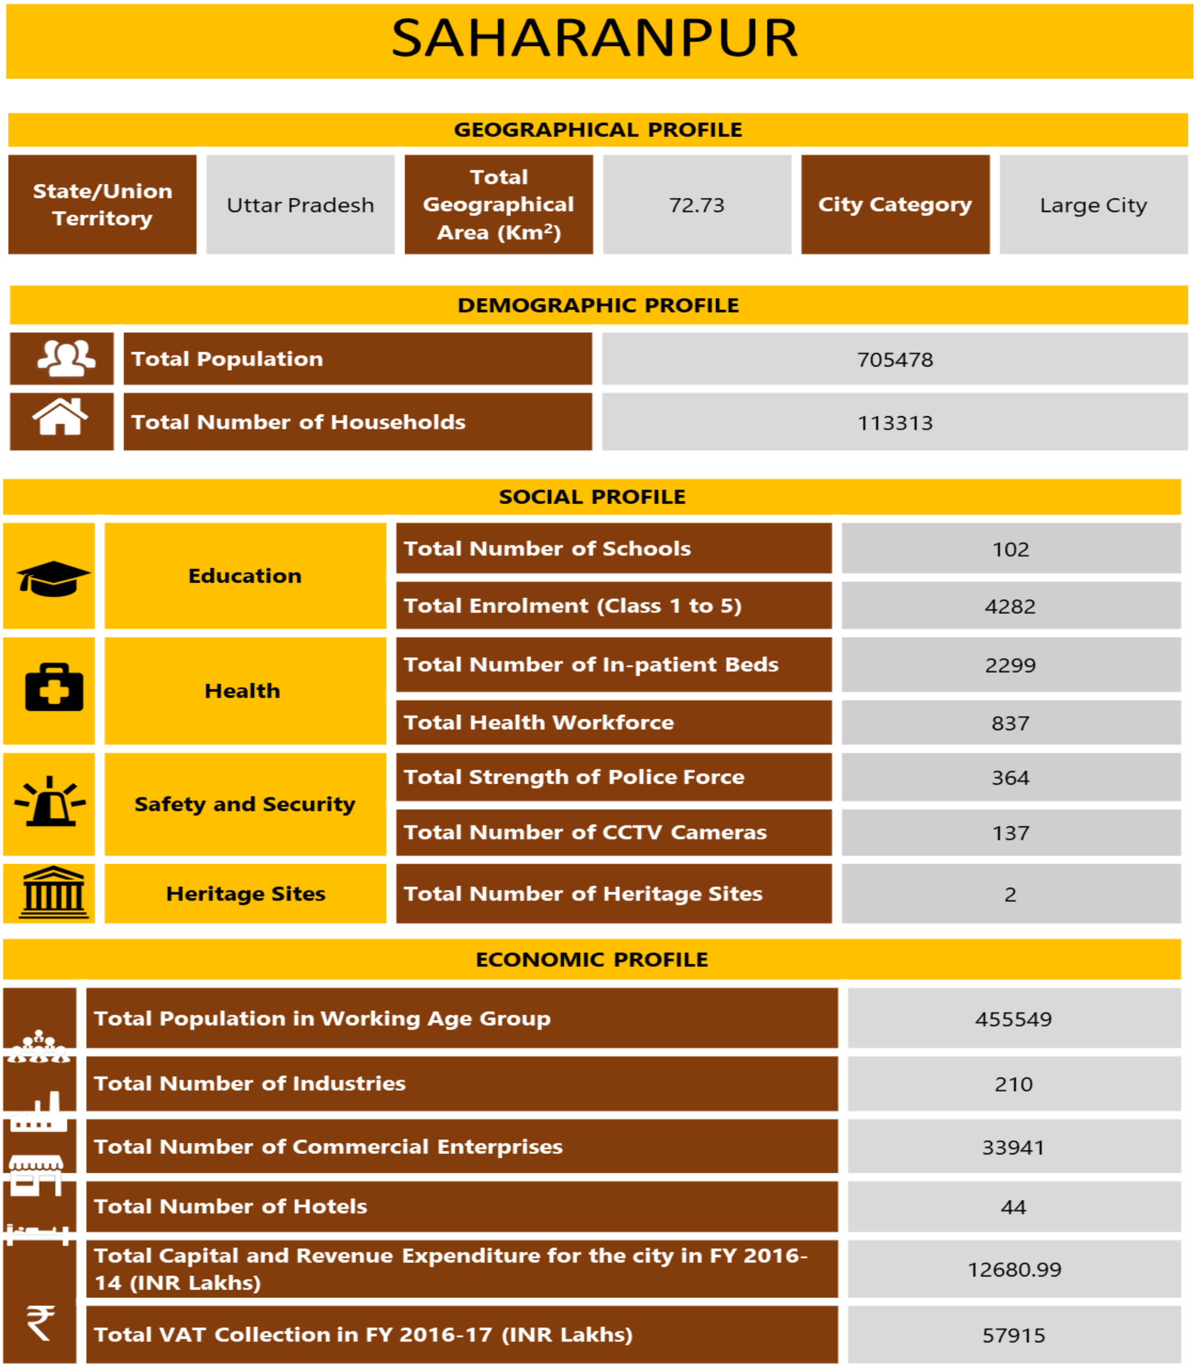
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SAHARANPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Uttar Pradesh	**Total Geographical Area (Km²)**	72.73	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	705478
Total Number of Households	113313

SOCIAL PROFILE

Education	**Total Number of Schools**	102
	Total Enrolment (Class 1 to 5)	4282
Health	**Total Number of In-patient Beds**	2299
	Total Health Workforce	837
Safety and Security	**Total Strength of Police Force**	364
	Total Number of CCTV Cameras	137
Heritage Sites	**Total Number of Heritage Sites**	2

ECONOMIC PROFILE

Total Population in Working Age Group	455549
Total Number of Industries	210
Total Number of Commercial Enterprises	33941
Total Number of Hotels	44
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	12680.99
Total VAT Collection in FY 2016-17 (INR Lakhs)	57915

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	105
		Total Number of Water Connection	78427
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	111625
		Total number of households in the city with access to community toilets in the city	
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	272
		Total number of households covered through door-to-door collection of solid waste	40260
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	84
		Daily average quantum of waste water treated by STPs in the city (MLD)	40
	Electricity	**Total number of authorized electrical connections in the city**	119399
		Total electricity supplied to the city (kWh)	614.344
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1859.5
		Total length of arterial and sub-arterial road network in the city (Km)	
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	5

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education

Pillars of Comprehensive Development	Category	Indicators
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage

Pillars of Comprehensive Development	Category	Indicators
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were

identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department Nagar nigam Shaharanpur
Urban Local Body	For Park and Recreation Related Questions	Udyan vibhag Nagar nigam Shaharanpur
Urban Local Body	For Water Supply and Drainage related questions	Jal Nigam/Jalkal vibhag Nagar nigam Shaharanpur
Urban Local Body	For Heritage sites related data	Archeological survey of India /in charge in ULB
Urban Local Body	For Ecological sites related data	Forest Department Shaharanpur
Urban Local Body	For Housing related data	Development Authority / Nirmaan Vibhag Nagar Nigam Shaharanpur
Urban Local Body	For Building plan related data	Development Authority Shaharanpur
Urban Local Body	For Roads related data	Public Works Department / Nirmaan Vibhag Nagar Nigam Shaharanpur
Urban Local Body	For Solid waste management related data	Health Department Nagar Nigam Shaharanpur
Urban Local Body	For IT services related data	Computer Department. Nagar Nigam Shaharanpur
Urban Local Body	For Vendor committee related data	District Urban Development Agency(DUDA) Shaharanpur
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Public Works Department ,Employment Exchange, District urban development Agency Shaharanpur
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Uttar Pradesh pollution Control Board Shaharanpur
Development Authority	Building Infrastructure	Moradabad development Authority Shaharanpur
	Construction planning	Moradabad development Authority Shaharanpur
	Green Building	Moradabad development Authority

Designated data owners	Subcategories	Data owners at city level
		Shaharanpur
	Rain water harvesting	Moradabad development Authority Shaharanpur
	Universal Design Principle	Moradabad development Authority Shaharanpur
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Uttar Pradesh Power Corporation Ltd Shaharanpur
State Disaster management authority		Shaharanpur Disaster Management in UP ADM (FR]
State Education Department		Basic Siksha Adhikari/district inspector of school Shaharanpur (DIOS)
State Health Department	Health care professionals	UP State Health Department Shaharanpur (CMO)
	Citizen Services	UP State Health Department Shaharanpur (CMO)
	Disease Prevalence	UP State Health Department Shaharanpur (CMO)
	Health Infrastructure	UP State Health Department Shaharanpur (CMO)
State Renewable Energy Development Agency	Renewable Energy	State Renewable Energy Develop. Agency(NEDA)
State Sales / Commercial Taxes Department		Commercial Taxes Department Shaharanpur Zone
Town and Country Planning Department	Land Use	Town and Country Planning Department Shaharanpur
Traffic and Police Department		Traffic police, Civil police & Grand Railway police Shaharanpur
Transport Authorities	Buses	Uttar Pradesh State transport Corporation & Regional Transport Office Shaharanpur
	Registered Vehicles	Regional Transport Office Shaharanpur
	Sub urban rail transport	N A
	Mono Rail Authority	N A
	Tramways	N A
	Marine Transport Authority	N A

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 12 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	1
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	1
Transport Authority	1
Disaster Management	1
Urban Local Body	1
Total	12*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	41.79%
Identity & Culture	0%
Education	26%
Health	90%
Safety & Security	60%
Economy & Employment	7%
Housing & Inclusiveness	4%
Public Open Spaces	0%
Mixed Land Use & Compactness	17%
Power Supply	75%
Transport & Mobility	27%
Assured Water Supply	49%
Waste Water Management	41%
Solid Waste Management	43%
Reduced Pollution	56%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

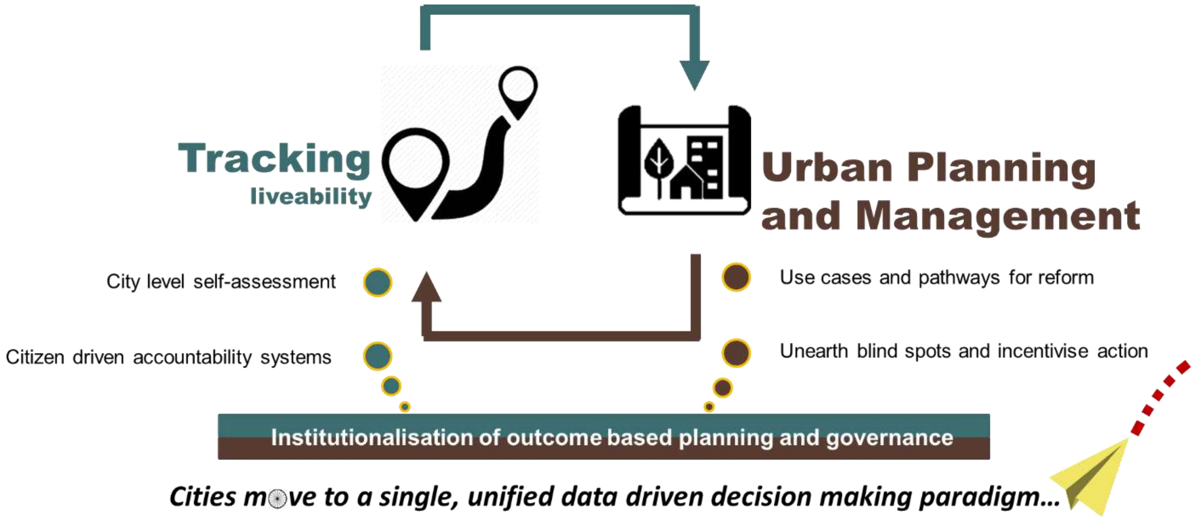
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

SALEM

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	Total Geographical Area (Km^2)	91.34	City Category	Large City

DEMOGRAPHIC PROFILE

Total Population	829267
Total Number of Households	215747

SOCIAL PROFILE

Education	Total Number of Schools	318
	Total Enrolment (Class 1 to 5)	59898
Health	Total Number of In-patients Beds	5385
	Total Health Workforce	1985
Safety and Security	Total Strength of Police Force	1406
	Total Number of CCTV Cameras	961
Heritage Sites	Total Number of Heritage Sites	2

ECONOMIC PROFILE

Total Population in Working Age Group	480976
Total Number of Industries	584
Total Number of Commercial Enterprises	19501
Total Number of Hotels	82
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	29968.19
Total VAT Collection in FY 2016-17 (INR Lakhs)	39736.95

PHYSICAL PROFILE

	Water	**Average Quantity of Water Supplied (MLD)**	121
		Total Number of Water Connections	105298
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	210570
		Total number of households in the city with access to community toilets in the city	24054
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	400
		Total number of households covered through door-to-door collection of solid waste	234624
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	91
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	**Total number of authorized electrical connections in the city**	443312
		Total electricity supplied to the city (kWh)	836895092
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	76621.82
	Roads and Transport	**Total Length of Road Network in the City (Km)**	848.63
		Total length of arterial and sub-arterial road network in the city (Km)	234
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	2.87

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population

Pillars of Comprehensive Development	Category	Indicators
		enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services

Pillars of Comprehensive Development	Category	Indicators
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting

Pillars of Comprehensive Development	Category	Indicators
		facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

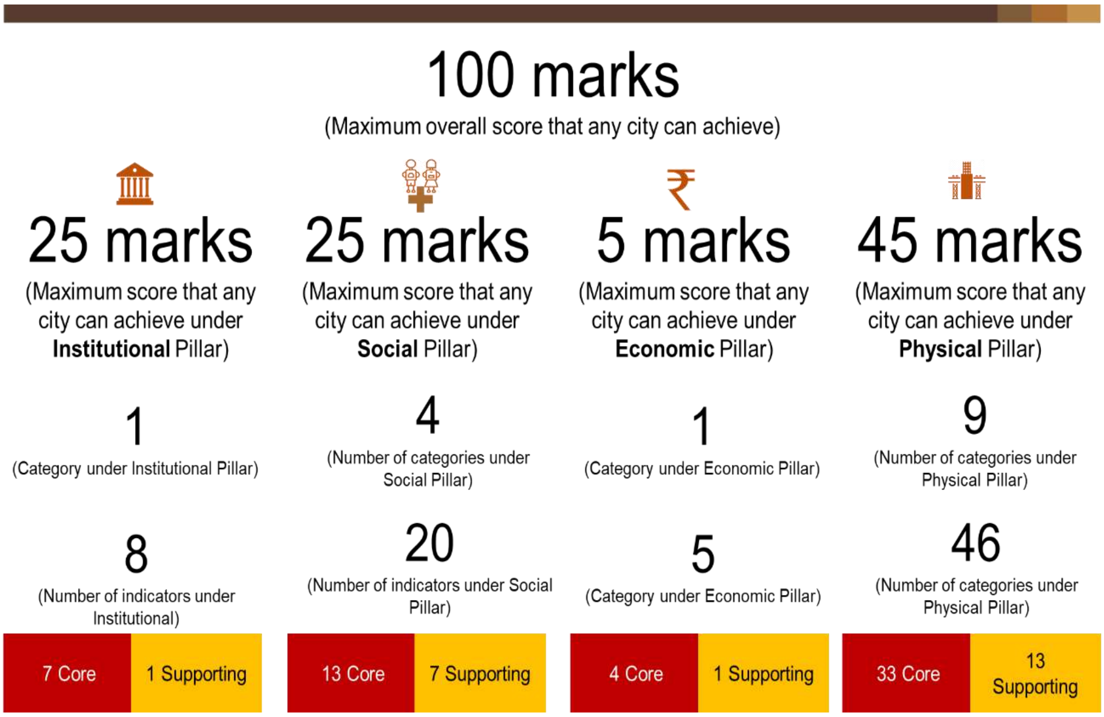
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Urban Local Body accounts department
Urban Local Body	For Park and Recreation Related Questions	Urban Local Body Town planning
Urban Local Body	For Water Supply and Drainage related questions	Urban Local Body Engineering section
Urban Local Body	For Heritage sites related data	Urban Local Body
Urban Local Body	For Ecological sites related data	Urban Local Body
Urban Local Body	For Housing related data	Slum Control Board and Health section
Urban Local Body	For Building plan related data	Town planning
Urban Local Body	For Roads related data	Urban Local Body Engineering section
Urban Local Body	For Solid waste management related data	Public Health section
Urban Local Body	For IT services related data	IT Section
Urban Local Body	For Vendor committee related data	Public Health section
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	No
Central / state Pollution control	Water Quality, Air Quality, Noise Quality	Pollution control Board

Designated data owners	Subcategories	Data owners at city level
Board		
Development Authority	Building Infrastructure	Development Authority
	Construction planning	Development Authority
	Green Building	Development Authority
	Rain water harvesting	Development Authority
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	DISCOM/Electricity Board
State Disaster management authority		State Disaster management authority
State Education Department		State Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		DISCOM/Electricity Board
State Sales / Commercial Taxes Department		State Sales / Commercial Taxes Department
Town and Country Planning Department	Land Use	Town and Country Planning Department
Traffic and Police Department		Traffic and Police Department
Transport Authorities	Buses	Transport Authorities
	Registered Vehicles	Transport Authorities
	Sub urban rail transport	Nil
	Mono Rail Authority	Nil
	Tramways	Nil
	Marine Transport Authority	Nil

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 117 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	2
State Education Department	5
DISCOM/Electricity Department	12
Traffic and Police Department	8
Development Authority	1
Pollution Control Board	7
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	12
Transport Authority	3
Disaster Management	1
Urban Local Body	64
Total	117*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

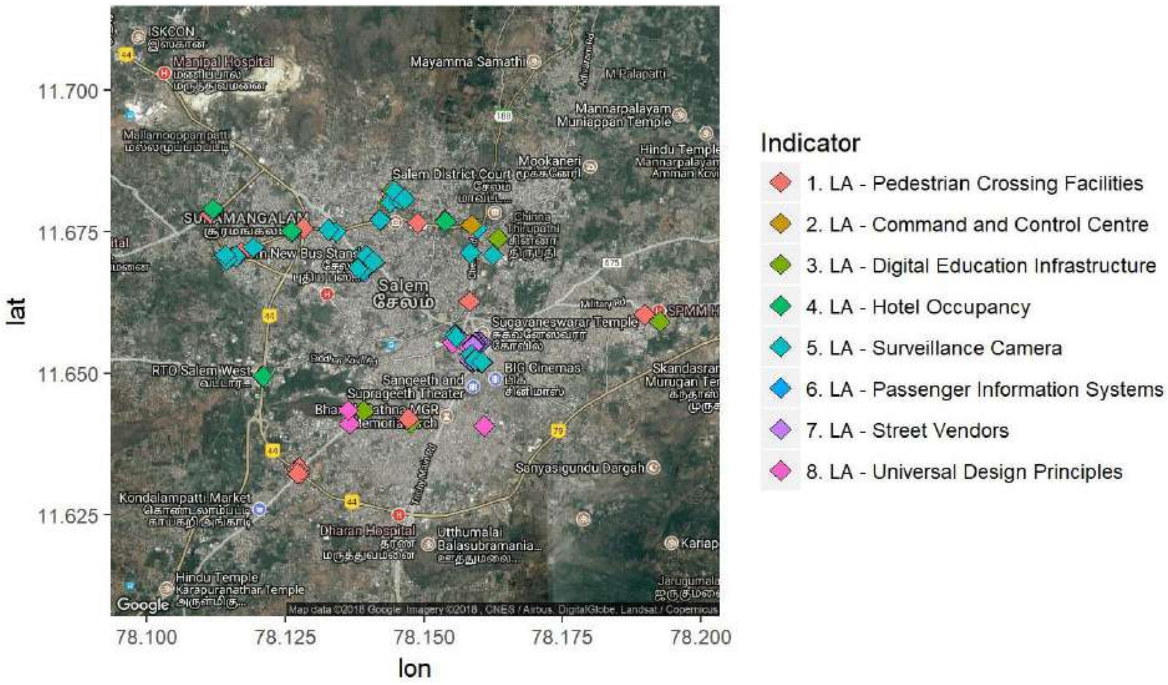
- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- **5.1**| Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

- 6.4 | Unemployment Rate
- 11.3 | Mode share of public transport
- 11.5 | Mode share of Non Motorized Transport
- 12.3 | Quality of Water Supplied
- 15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.



Indicator
1. LA - Pedestrian Crossing Facilities
2. LA - Command and Control Centre
3. LA - Digital Education Infrastructure
4. LA - Hotel Occupancy

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	57.09%
Identity & Culture	69%
Education	85%
Health	99%
Safety & Security	64%
Economy & Employment	33%
Housing & Inclusiveness	36%
Public Open Spaces	0%
Mixed Land Use & Compactness	37%
Power Supply	56%
Transport & Mobility	11%
Assured Water Supply	66%
Waste Water Management	55%
Solid Waste Management	69%
Reduced Pollution	77%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

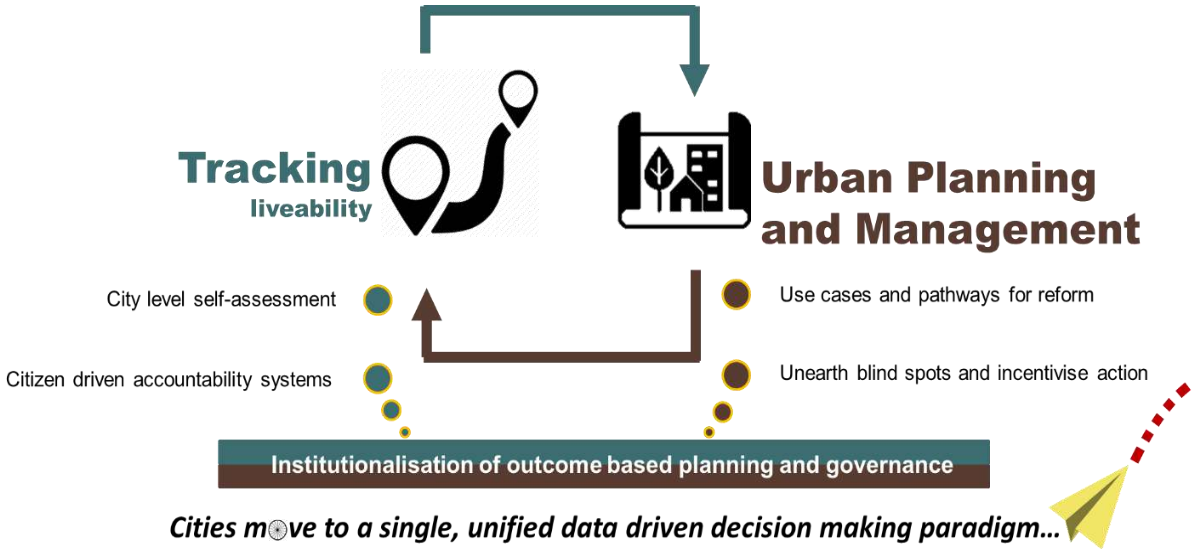
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

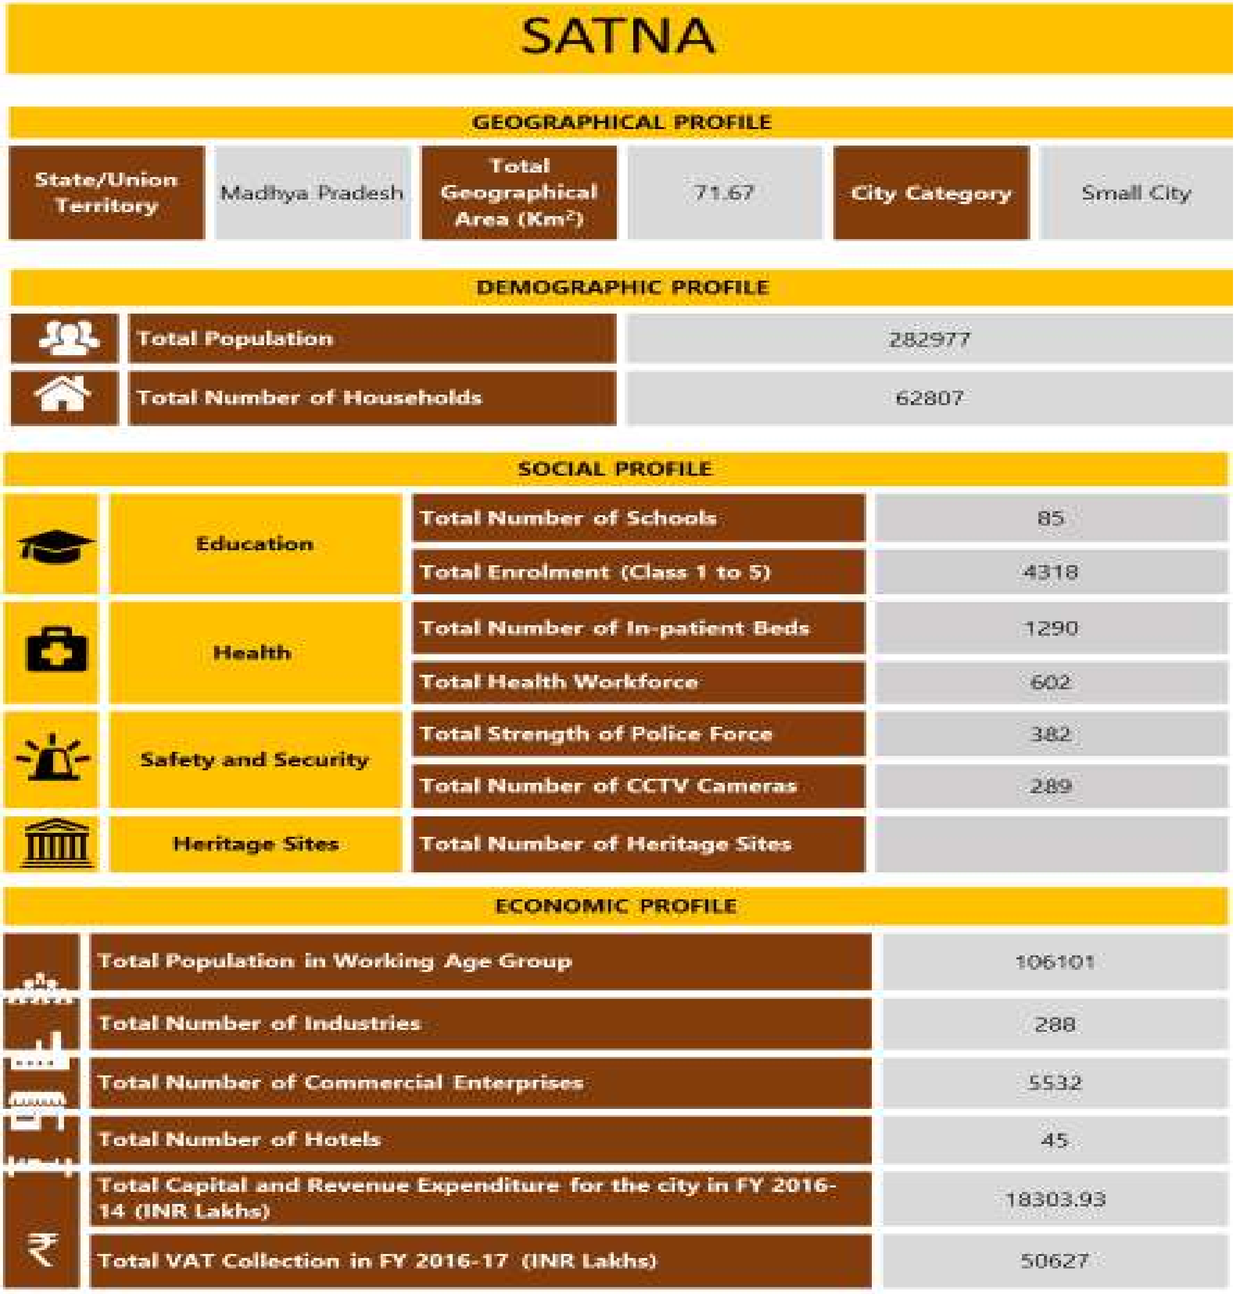


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SATNA

GEOGRAPHICAL PROFILE

State/Union Territory	Madhya Pradesh	**Total Geographical Area (Km²)**	71.67	**City Category**	Small City

DEMOGRAPHIC PROFILE

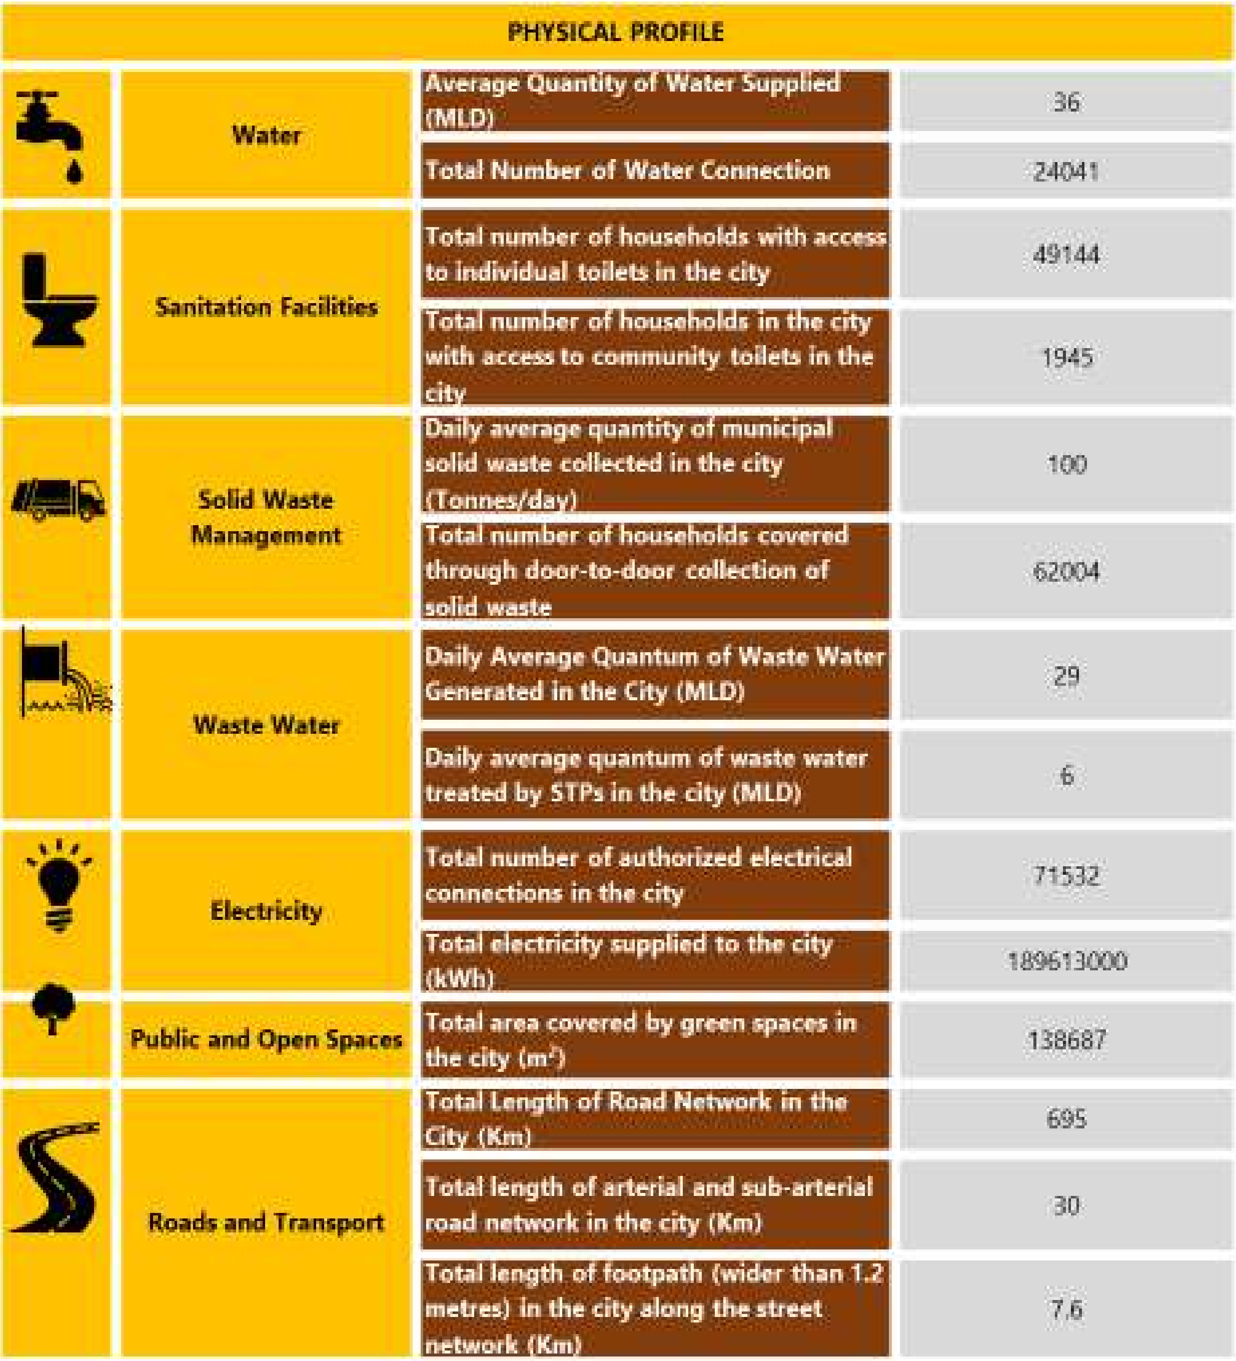
Total Population	282977
Total Number of Households	62807

SOCIAL PROFILE

Education	**Total Number of Schools**	85
	Total Enrolment (Class 1 to 5)	4318
Health	**Total Number of In-patient Beds**	1290
	Total Health Workforce	602
Safety and Security	**Total Strength of Police Force**	382
	Total Number of CCTV Cameras	289
Heritage Sites	**Total Number of Heritage Sites**	

ECONOMIC PROFILE

Total Population in Working Age Group	106101
Total Number of Industries	288
Total Number of Commercial Enterprises	5532
Total Number of Hotels	45
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	18303.93
Total VAT Collection in FY 2016-17 (INR Lakhs)	50627



PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	36
	Total Number of Water Connection	24041
Sanitation Facilities	Total number of households with access to individual toilets in the city	49144
	Total number of households in the city with access to community toilets in the city	1945
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	100
	Total number of households covered through door-to-door collection of solid waste	62004
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	29
	Daily average quantum of waste water treated by STPs in the city (MLD)	6
Electricity	Total number of authorized electrical connections in the city	71532
	Total electricity supplied to the city (kWh)	189613000
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	138687
Roads and Transport	Total Length of Road Network in the City (Km)	695
	Total length of arterial and sub-arterial road network in the city (Km)	30
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	7.6

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools

Pillars of Comprehensive Development	Category	Indicators
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered

Pillars of Comprehensive Development	Category	Indicators
		through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility

Pillars of Comprehensive Development	Category	Indicators
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)		25 marks (Maximum score that any city can achieve under **Social** Pillar)		5 marks (Maximum score that any city can achieve under **Economic** Pillar)		45 marks (Maximum score that any city can achieve under **Physical** Pillar)	
1 (Category under Institutional Pillar)		4 (Number of categories under Social Pillar)		1 (Category under Economic Pillar)		9 (Number of categories under Physical Pillar)	
8 (Number of indicators under Institutional)		20 (Number of indicators under Social Pillar)		5 (Category under Economic Pillar)		46 (Number of categories under Physical Pillar)	
7 Core	1 Supporting	13 Core	7 Supporting	4 Core	1 Supporting	33 Core	13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different

categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Sub categories	Data owners at city level
Urban Local Body	Accounts	Accounting Department, Satna Municipal Corporation
	Park and Recreation	Satna Municipal Corporation
	Water Supply and Drainage	Engineering Department, Satna Municipal Corporation
	Heritage sites	Satna Municipal Corporation
	Ecological sites	Satna Municipal Corporation
	Housing	Housing section, Satna Municipal Corporation
	Building plan	Satna Municipal Corporation
	Roads	Roads section, Satna Municipal Corporation
	Solid waste management	Satna Municipal Corporation
	IT services	IT Section, Satna Municipal Corporation
	Vendor committee	Satna Municipal Corporation
	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Madhya Pradesh Pollution Control Board
Development Authority	Building Infrastructure	MP Housing and Infrastructure development board
	Construction planning	MP Housing and Infrastructure development board
	Green Building	MP Housing and Infrastructure development board
	Rain water harvesting	MP Housing and Infrastructure development board
	Universal Design Principle	MP Housing and Infrastructure development board
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Madhya Pradesh Poorv Kshetra Vidyut Vitaran Company limited
State Disaster management authority		District Disaster management Office

Designated data owners	Sub categories	Data owners at city level
State Education Department		District Education Department
State Health Department	Health care professionals	Health Department
	Citizen Services	Health Department
	Disease Prevalence	Health Department
	Health Infrastructure	Health Department
State Renewable Energy Development Agency		Madhya Pradesh New and Renewable energy Department
State Sales / Commercial Taxes Department		Department of Commercial Taxes
Town and Country Planning Department	Land Use	Town and country planning
Traffic and Police Department		Traffic and Police Department, Satna
Transport Authorities	Buses	Regional Transport Office
	Registered Vehicles	Madhya Pradesh Transport Department
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 118 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	1
DISCOM/Electricity Department	2
Traffic and Police Department	1
Development Authority	6
Pollution Control Board	5
State Renewable Energy Department	1
Town and Country Planning	2
State Health Department	3
Transport Authority	7
Disaster Management	2
Urban Local Body	88
Total	118

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	49.40%
Identity & Culture	61%
Education	54%
Health	98%
Safety & Security	66%
Economy & Employment	48%
Housing & Inclusiveness	12%
Public Open Spaces	2%
Mixed Land Use & Compactness	0%
Power Supply	56%
Transport & Mobility	65%
Assured Water Supply	76%
Waste Water Management	57%
Solid Waste Management	99%
Reduced Pollution	72%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

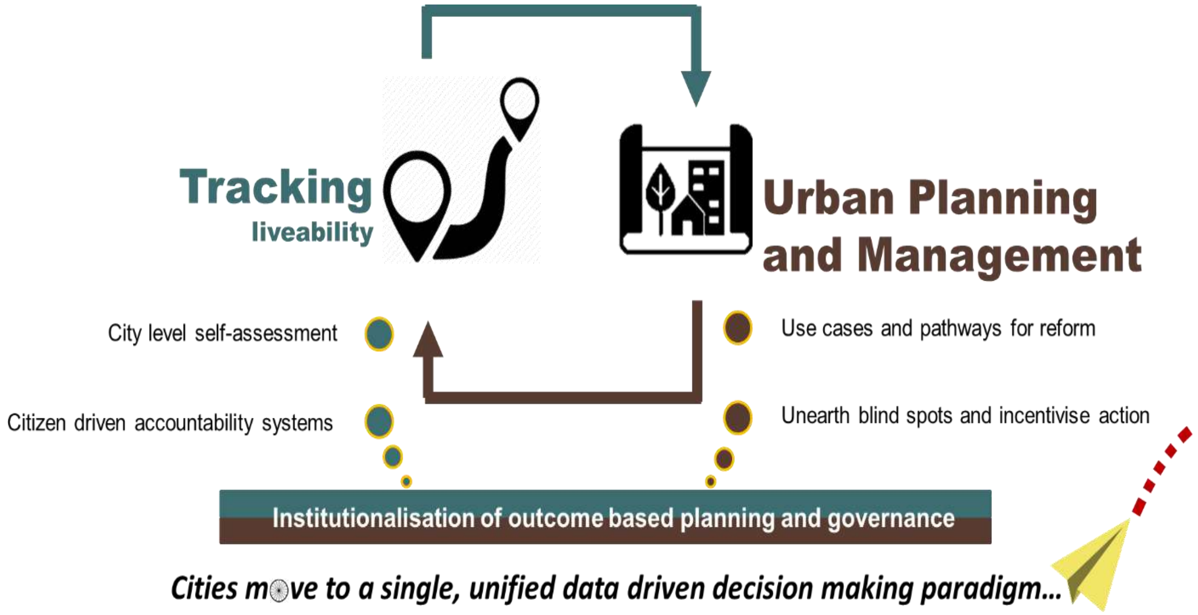
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking

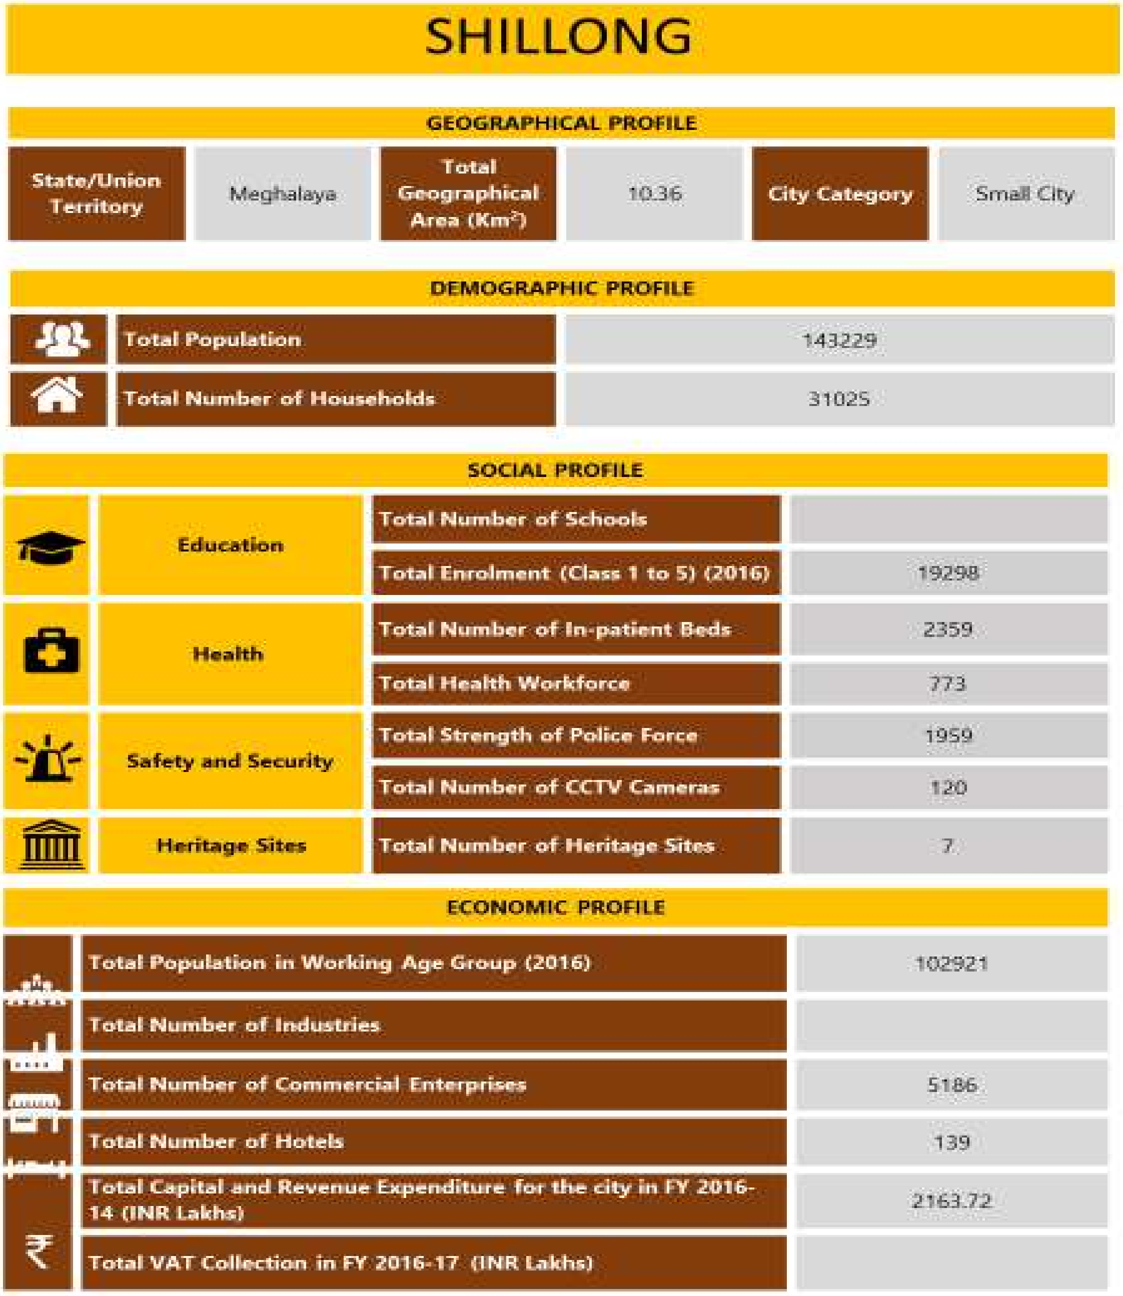
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SHILLONG

GEOGRAPHICAL PROFILE

State/Union Territory	Meghalaya	Total Geographical Area (Km²)	10.36	City Category	Small City

DEMOGRAPHIC PROFILE

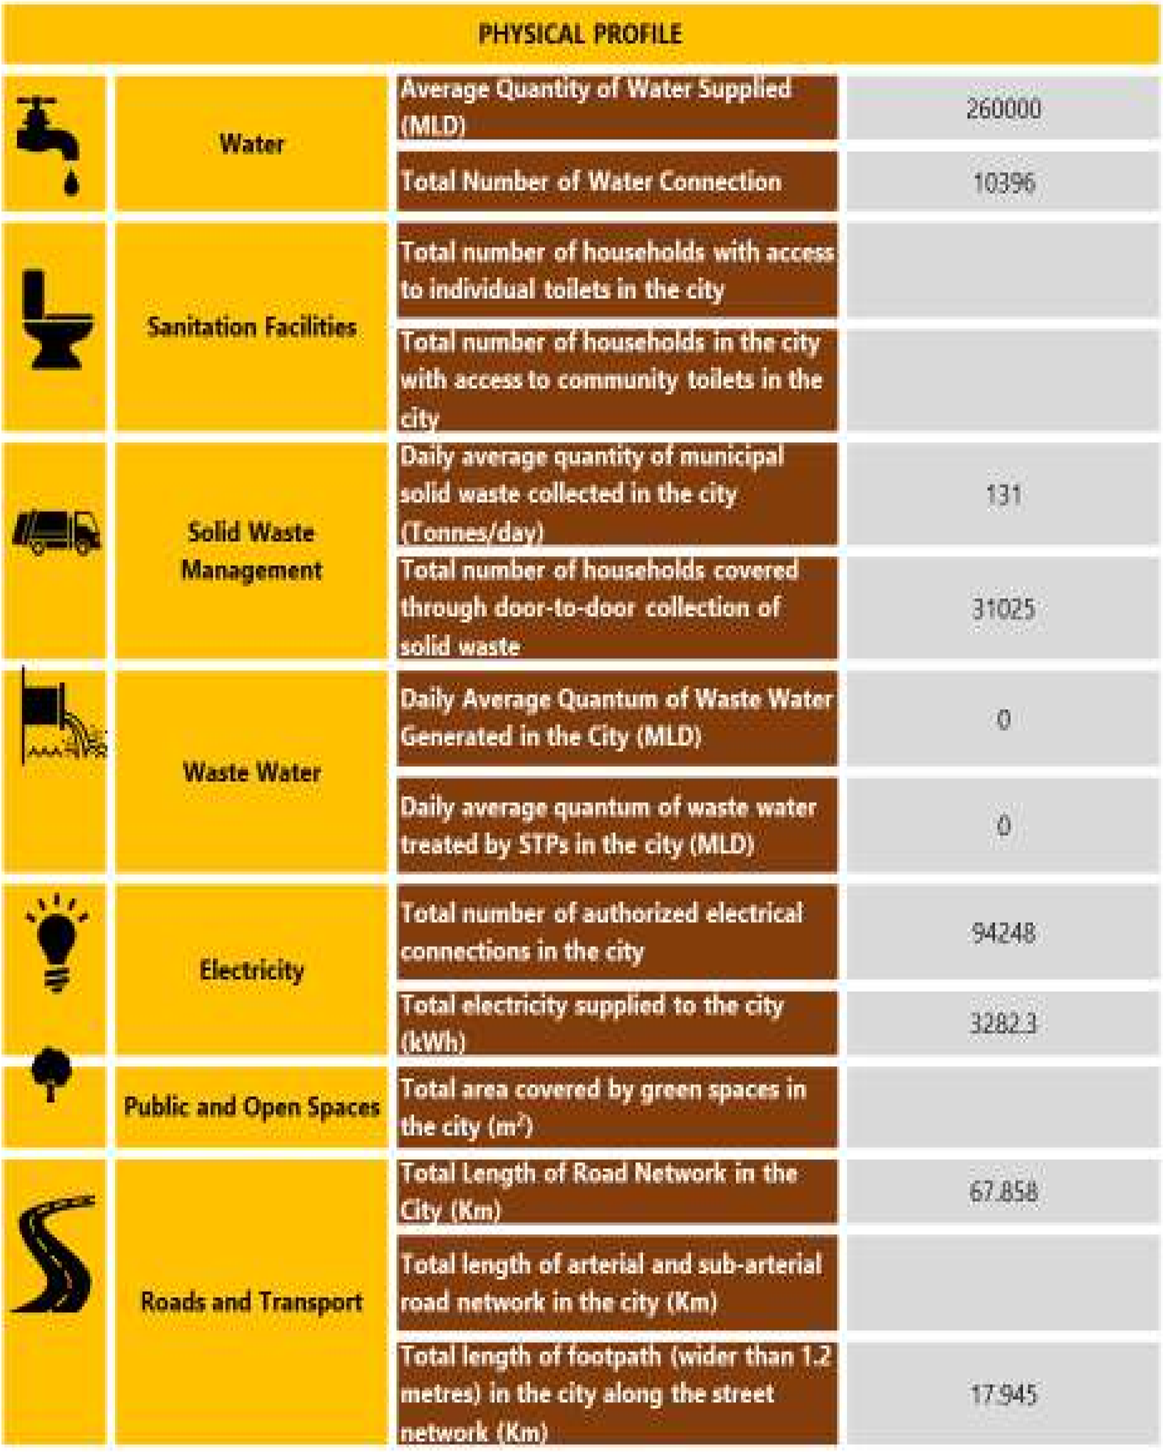
Total Population	143229
Total Number of Households	31025

SOCIAL PROFILE

Education	Total Number of Schools	
	Total Enrolment (Class 1 to 5) (2016)	19298
Health	Total Number of In-patient Beds	2359
	Total Health Workforce	773
Safety and Security	Total Strength of Police Force	1959
	Total Number of CCTV Cameras	120
Heritage Sites	Total Number of Heritage Sites	7

ECONOMIC PROFILE

Total Population in Working Age Group (2016)	102921
Total Number of Industries	
Total Number of Commercial Enterprises	5186
Total Number of Hotels	139
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	2163.72
Total VAT Collection in FY 2016-17 (INR Lakhs)	



PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	260000
	Total Number of Water Connection	10396
Sanitation Facilities	Total number of households with access to individual toilets in the city	
	Total number of households in the city with access to community toilets in the city	
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	131
	Total number of households covered through door-to-door collection of solid waste	31025
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	0
	Daily average quantum of waste water treated by STPs in the city (MLD)	0
Electricity	Total number of authorized electrical connections in the city	94248
	Total electricity supplied to the city (kWh)	3282.3
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	
Roads and Transport	Total Length of Road Network in the City (Km)	67.858
	Total length of arterial and sub-arterial road network in the city (Km)	
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	17.945

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy

Pillars of Comprehensive Development	Category	Indicators
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	6. Economy and Employment	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax

Pillars of Comprehensive Development	Category	Indicators
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11.	11.1 Geographical coverage of public transport

Pillars of Comprehensive Development	Category	Indicators
	Transportation and Mobility	11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage

Pillars of Comprehensive Development	Category	Indicators
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

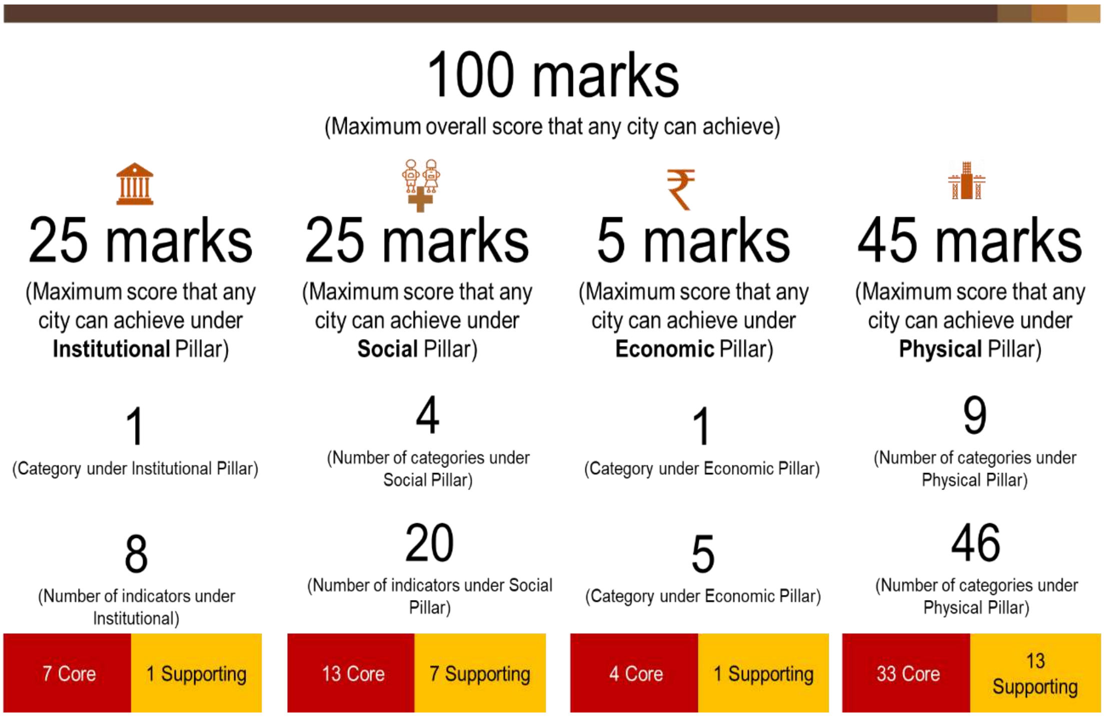
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	ULB
Urban Local Body	For Park and Recreation Related Questions	ULB
Urban Local Body	For Water Supply and Drainage related questions	ULB & PHE
Urban Local Body	For Heritage sites related data	NIL
Urban Local Body	For Ecological sites related data	NIL
Urban Local Body	For Housing related data	ULB & Meghalaya Urban Development Authority
Urban Local Body	For Building plan related data	ULB & Directorate of Urban Affair, Meghalaya Urban Development Authority
Urban Local Body	For Roads related data	ULB &PWD
Urban Local Body	For Solid waste management related data	ULB
Urban Local Body	For IT services related data	ULB
Urban Local Body	For Vendor committee related data	ULB and Directorate of Urban Affair
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	PWD, PHE, Directorate of Urban Affair, Meghalaya Urban Development Authority
For questions under Central / state Pollution control	Water Quality, Air Quality, Noise Quality	MEGHALAYA STATE POLLUTION CONTROL BOARD

Designated data owners	Subcategories	Data owners at city level
Board		
Development Authority	Building Infrastructure	MUDA
	Construction planning	MUDA
	Green Building	MUDA
	Rain water harvesting	MUDA
	Universal Design Principle	MUDA
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Meghalaya Power Distribution Corporation LTD.
State Disaster management authority		State disaster management authority
State Education Department		Directorate of school education and literacy
State Health Department	Health care professionals	Directorate of health complex and services, Shillong
State Health Department	Citizen Services	DO
State Health Department	Disease Prevalence	DO
State Health Department	Health Infrastructure	DO
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		
Town and Country Planning Department	Land Use	Urban Affairs Department
Traffic and Police Department		Shillong Police (traffic)
Transport Authorities	Buses	District Transport Office
Transport Authorities	Registered Vehicles	District Transport Office
Transport Authorities	Sub urban rail transport	NIL
Transport Authorities	Mono Rail Authority	NIL
Transport Authorities	Tramways	NIL
Transport Authorities	Marine Transport Authority	NIL

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 24 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	0
State Education Department	2
DISCOM/Electricity Department	3
Traffic and Police Department	1
Development Authority	1
Pollution Control Board	5
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	1
Transport Authority	1
Disaster Management	1
Urban Local Body	7
Total	24

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the

field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	21.12%
Identity & Culture	11%
Education	0%
Health	99%
Safety & Security	57%
Economy & Employment	16%
Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	52%
Transport & Mobility	21%
Assured Water Supply	37%
Waste Water Management	0%
Solid Waste Management	63%
Reduced Pollution	63%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

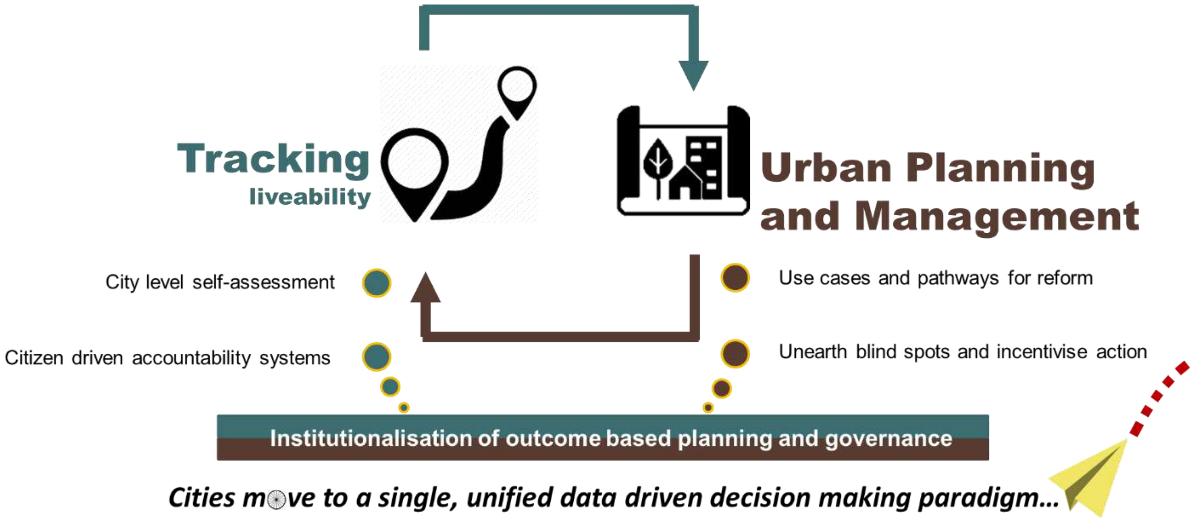
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

SHIMLA

GEOGRAPHICAL PROFILE

State/Union Territory	Himachal Pradesh	**Total Geographical Area (Km²)**	35.34	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	169578
Total Number of Households	25952

SOCIAL PROFILE

Education	**Total Number of Schools**	146
	Total Enrolment (Class 1 to 5)	13917
Health	**Total Number of In-patient Beds**	259
	Total Health Workforce	328
Safety and Security	**Total Strength of Police Force**	203
	Total Number of CCTV Cameras	111
Heritage Sites	**Total Number of Heritage Sites**	0

ECONOMIC PROFILE

Total Population in Working Age Group (2016)	128294
Total Number of Industries	0
Total Number of Commercial Enterprises	
Total Number of Hotels	253
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	13388.5
Total VAT Collection in FY 2016-17 (INR Lakhs)	2028836539

PHYSICAL PROFILE		
Water	Average Quantity of Water Supplied (MLD)	33
	Total Number of Water Connection	30995
Sanitation Facilities	Total number of households with access to individual toilets in the city	30995
	Total number of households in the city with access to community toilets in the city	1499
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	70
	Total number of households covered through door-to-door collection of solid waste	34992
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	24
	Daily average quantum of waste water treated by STPs in the city (MLD)	7.358
Electricity	Total number of authorized electrical connections in the city	39360
	Total electricity supplied to the city (kWh)	1333867563
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	
Roads and Transport	Total Length of Road Network in the City (Km)	142.636
	Total length of arterial and sub-arterial road network in the city (Km)	0
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	73.7

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

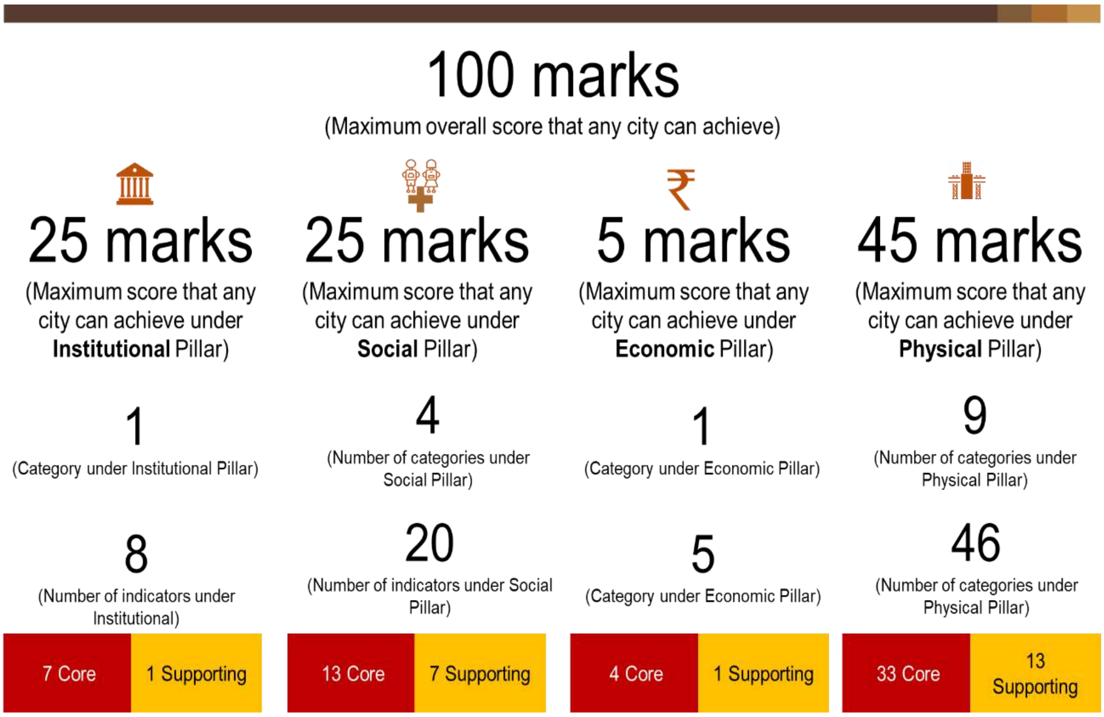
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under **Institutional** Pillar)
25 marks
(Maximum score that any city can achieve under **Social** Pillar)
5 marks
(Maximum score that any city can achieve under **Economic** Pillar)
45 marks
(Maximum score that any city can achieve under **Physical** Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core

13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	MC Shimla
Urban Local Body	For Park and Recreation Related Questions	MC Shimla
Urban Local Body	For Water Supply and Drainage related questions	MC Shimla
Urban Local Body	For Heritage sites related data	Tourism Department
Urban Local Body	For Ecological sites related data	MC Shimla
Urban Local Body	For Housing related data	MC Shimla
Urban Local Body	For Building plan related data	MC Shimla
Urban Local Body	For Roads related data	Public Work Department
Urban Local Body	For Solid waste management related data	MC Shimla
Urban Local Body	For IT services related data	IT Shimla
Urban Local Body	For Vendor committee related data	MC Shimla
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Tourism, PWD, Education, RTO and electricity board.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board Department
Development Authority	Building Infrastructure	MC Shimla
	Construction planning	MC Shimla
	Green Building	MC Shimla

Designated data owners	Subcategories	Data owners at city level
	Rain water harvesting	MC Shimla
	Universal Design Principle	MC Shimla
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Board Department
State Disaster management authority		State disaster management department
State Education Department		Directory of state elementary
State Health Department	Health care professionals	Chief Medical Officer
	Citizen Services	CMO
	Disease Prevalence	CMO
	Health Infrastructure	CMO
State Renewable Energy Development Agency		Renewable Energy Development department
State Sales / Commercial Taxes Department		Taxation Department
Town and Country Planning Department	Land Use	Town and country Planning Department
Traffic and Police Department		Police Department
Transport Authorities	Buses	Regional transportation Office
	Registered Vehicles	RTO
	Sub urban rail transport	RTO
	Mono Rail Authority	RTO
	Tramways	RTO
	Marine Transport Authority	RTO

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 31 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	0
Pollution Control Board	3
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	3
Transport Authority	1
Disaster Management	0
Urban Local Body	18
Total	31*

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	32.20%
Identity & Culture	13%
Education	89%
Health	80%
Safety & Security	66%
Economy & Employment	15%
Housing & Inclusiveness	3%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	32%
Transport & Mobility	28%
Assured Water Supply	57%
Waste Water Management	31%
Solid Waste Management	83%
Reduced Pollution	83%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

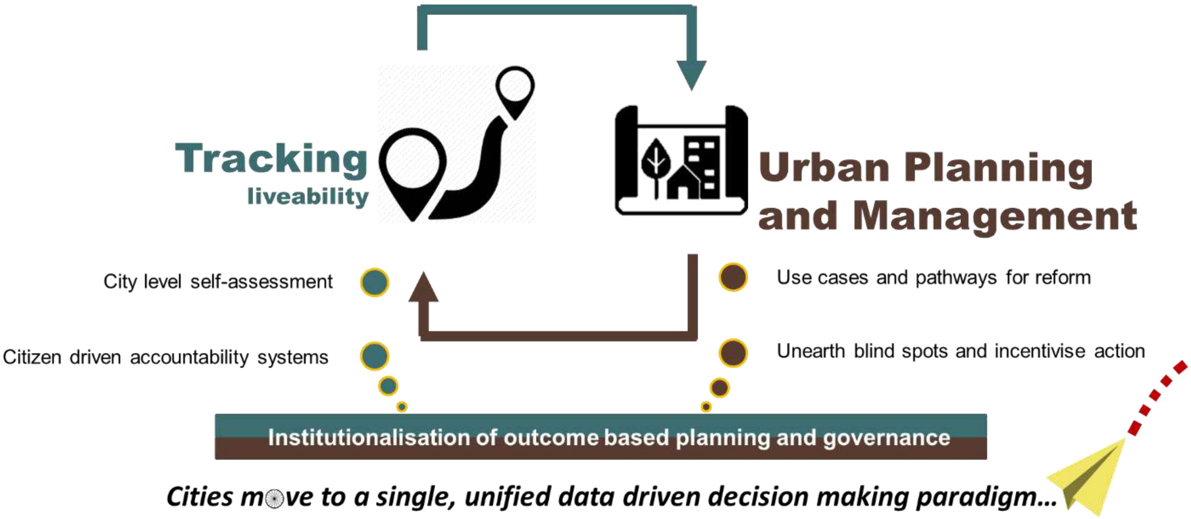
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

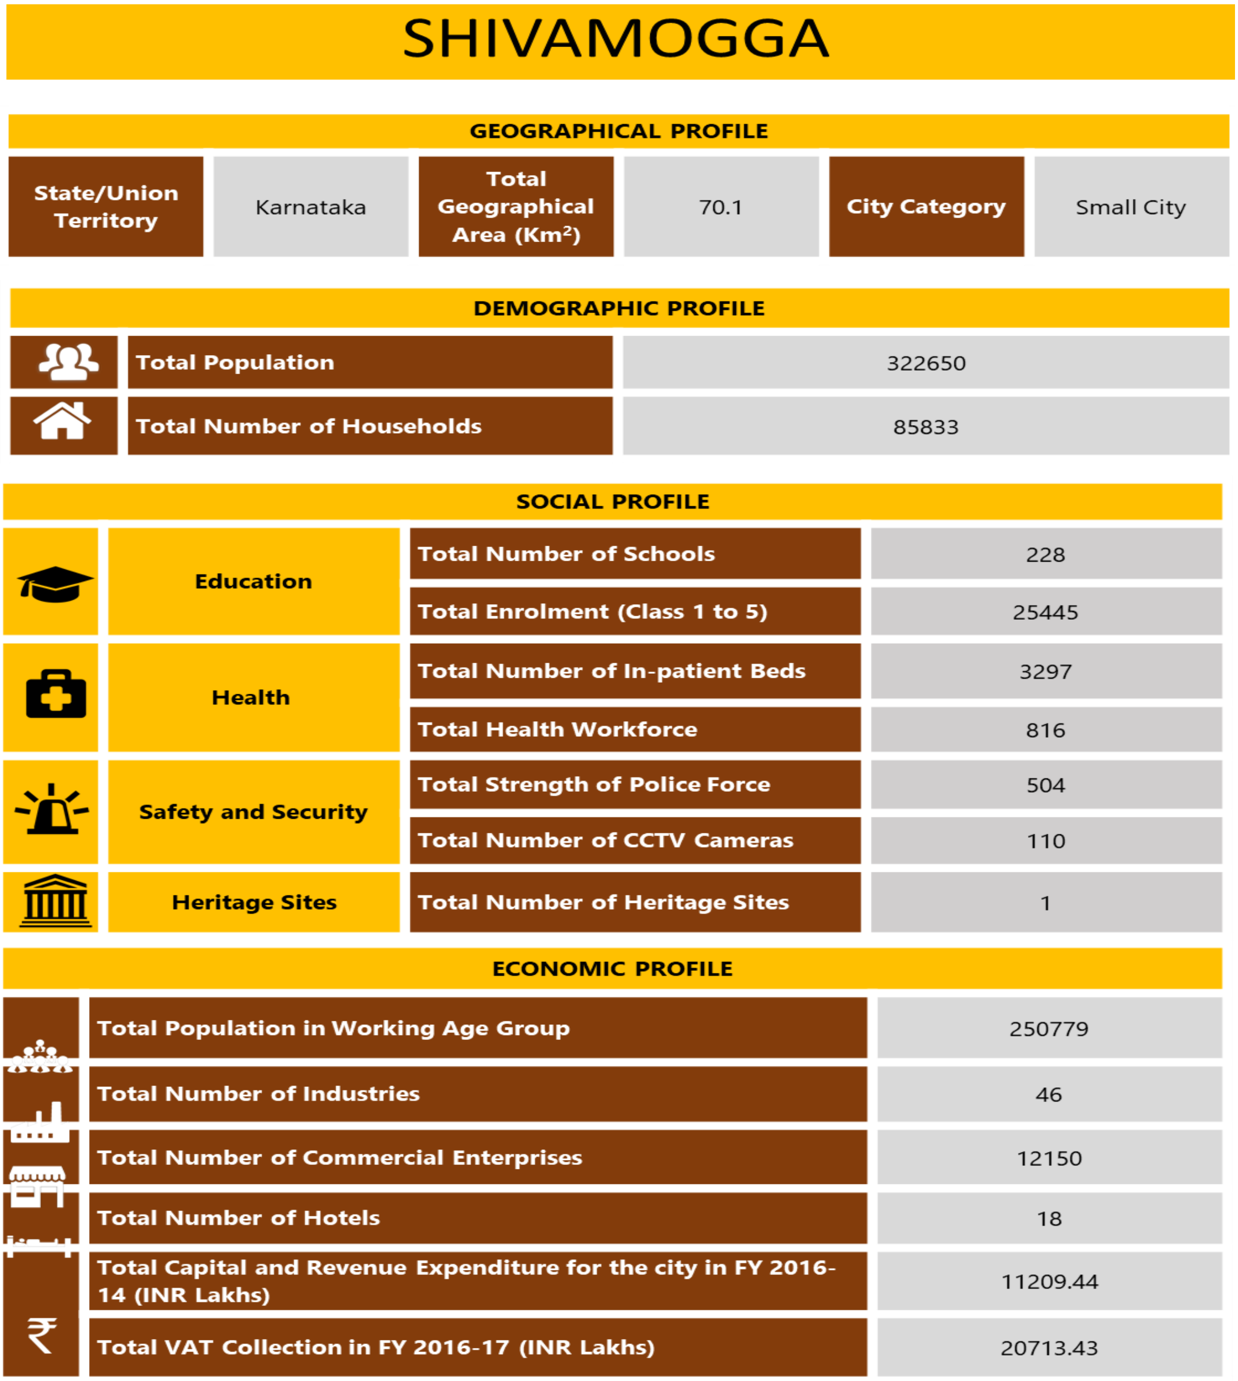


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SHIVAMOGGA

GEOGRAPHICAL PROFILE

State/Union Territory	Karnataka	**Total Geographical Area (Km²)**	70.1	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	322650
Total Number of Households	85833

SOCIAL PROFILE

Education	**Total Number of Schools**	228
	Total Enrolment (Class 1 to 5)	25445
Health	**Total Number of In-patient Beds**	3297
	Total Health Workforce	816
Safety and Security	**Total Strength of Police Force**	504
	Total Number of CCTV Cameras	110
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	250779
Total Number of Industries	46
Total Number of Commercial Enterprises	12150
Total Number of Hotels	18
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	11209.44
Total VAT Collection in FY 2016-17 (INR Lakhs)	20713.43

PHYSICAL PROFILE		
Water	**Average Quantity of Water Supplied (MLD)**	84
	Total Number of Water Connection	42346
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	67694
	Total number of households in the city with access to community toilets in the city	1147
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	112
	Total number of households covered through door-to-door collection of solid waste	62700
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	12.32
	Daily average quantum of waste water treated by STPs in the city (MLD)	12.32
Electricity	**Total number of authorized electrical connections in the city**	130059
	Total electricity supplied to the city (kWh)	221458095
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	1202000
Roads and Transport	**Total Length of Road Network in the City (Km)**	917
	Total length of arterial and sub-arterial road network in the city (Km)	35.75
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	9.3

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from

Pillars of Comprehensive Development	Category	Indicators
		renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or

Pillars of Comprehensive Development	Category	Indicators
		septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

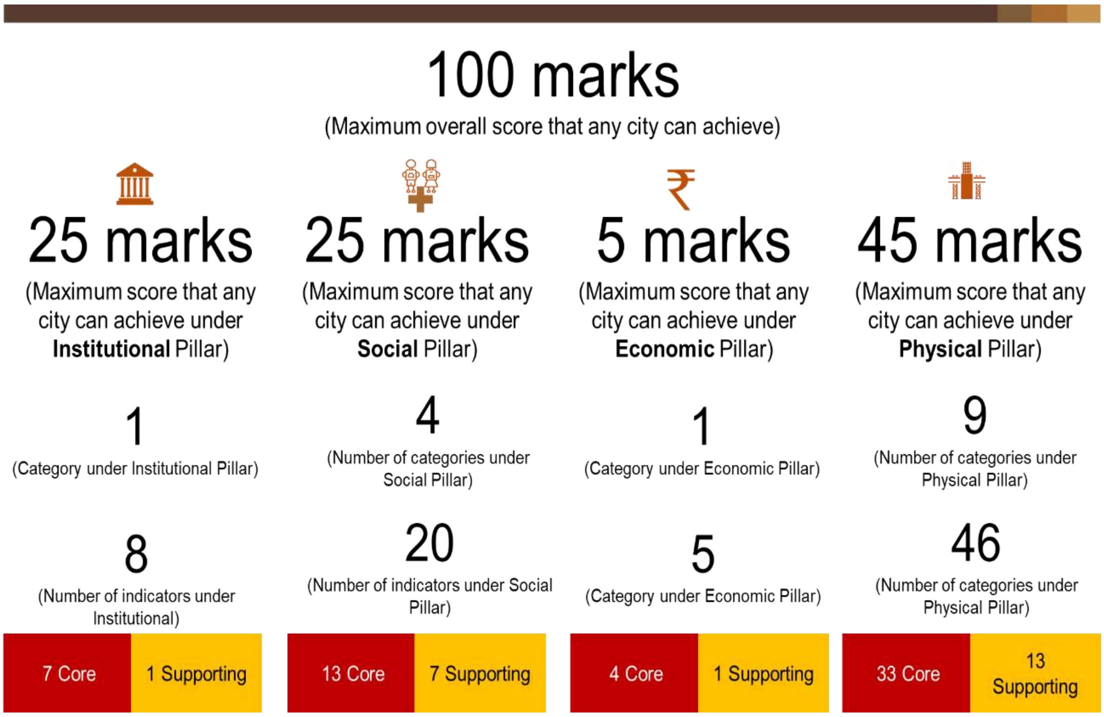
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
1
(Category under Institutional Pillar)
8
(Number of indicators under Institutional)
7 Core
1 Supporting
25 marks
(Maximum score that any city can achieve under Social Pillar)
4
(Number of categories under Social Pillar)
20
(Number of indicators under Social Pillar)
13 Core
7 Supporting
5 marks
(Maximum score that any city can achieve under Economic Pillar)
1

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Department Shivamogga Smart City Limited (SSCL)
Urban Local Body	For Park and Recreation Related Questions	Town Planning Department SSCL
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department SSCL
Urban Local Body	For Heritage sites related data	Town Planning Department SSCL
Urban Local Body	For Ecological sites related data	Department of forest, ecology and environment
Urban Local Body	For Housing related data	Rajiv Gandhi rural housing corporation limited. SSCL
Urban Local Body	For Building plan related data	Town Planning Department SSCL
Urban Local Body	For Roads related data	Engineering Department SSCL
Urban Local Body	For Solid waste management related data	Environment Department
Urban Local Body	For IT services related data	IT Department
Urban Local Body	For Vendor committee related data	Urban Poverty Alleviation Cell Deendayal Antyodaya Yojana National Urban Livelihood Mission. (DAY_NULM)
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Commercial Tax Department (Professional Tax related queries), Education Department (Population of age group between 6-14), Revenue Department, PMAY, District Employment Exchange, Development Authority, DULT (CMP related), KMDS (No. of Hits in the online service portals), Health Department, Pollution Department
Central / state Pollution control	Water Quality, Air Quality, Noise Quality	State Pollution department

Designated data owners	Subcategories	Data owners at city level
Board		
Development Authority	Building Infrastructure	Development Authority
	Construction planning	Development Authority and Town Planning Department, SSCL
	Green Building	Town Planning Department, SSCL
	Rain water harvesting	Town Planning Department, SSCL
	Universal Design Principle	Development Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Mangalore Electricity Supply Company Limited
State Disaster management authority		Deputy Commissioner Office
State Education Department		Coordinator – SSA
State Health Department	Health care professionals	District Health Office / Taluk Health Office
	Citizen Services	District Health Office / Taluk Health Office
	Disease Prevalence	District Health Office / Taluk Health Office
	Health Infrastructure	District Health Office / Taluk Health Office
State Renewable Energy Development Agency	Renewable Energy	Mangalore Electricity Supply Company Limited
State Sales / Commercial Taxes Department		Assistant Commissioner, Commercial Tax Office
Town and Country Planning Department	Land Use	Development Authority
Traffic and Police Department		Deputy Police Commissioner’s Office
Transport Authorities	Buses	Regional Transport Officer Office
	Registered Vehicles	Regional Transport Officer Office
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 131 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**4**
DISCOM/Electricity Department	**5**
Traffic and Police Department	**2**
Development Authority	**8**
Pollution Control Board	**2**
State Renewable Energy Department	**3**
Town and Country Planning	**1**
State Health Department	**6**
Transport Authority	**4**
Disaster Management	**1**
Urban Local Body	**93**
Total	**131***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	52.11%
Identity & Culture	2%
Education	78%
Health	99%
Safety & Security	60%
Economy & Employment	28%
Housing & Inclusiveness	4%
Public Open Spaces	25%
Mixed Land Use & Compactness	14%
Power Supply	53%
Transport & Mobility	27%
Assured Water Supply	73%
Waste Water Management	54%
Solid Waste Management	56%
Reduced Pollution	10%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the con-	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the

#	Challenges	Proposed Solutions
	sortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.

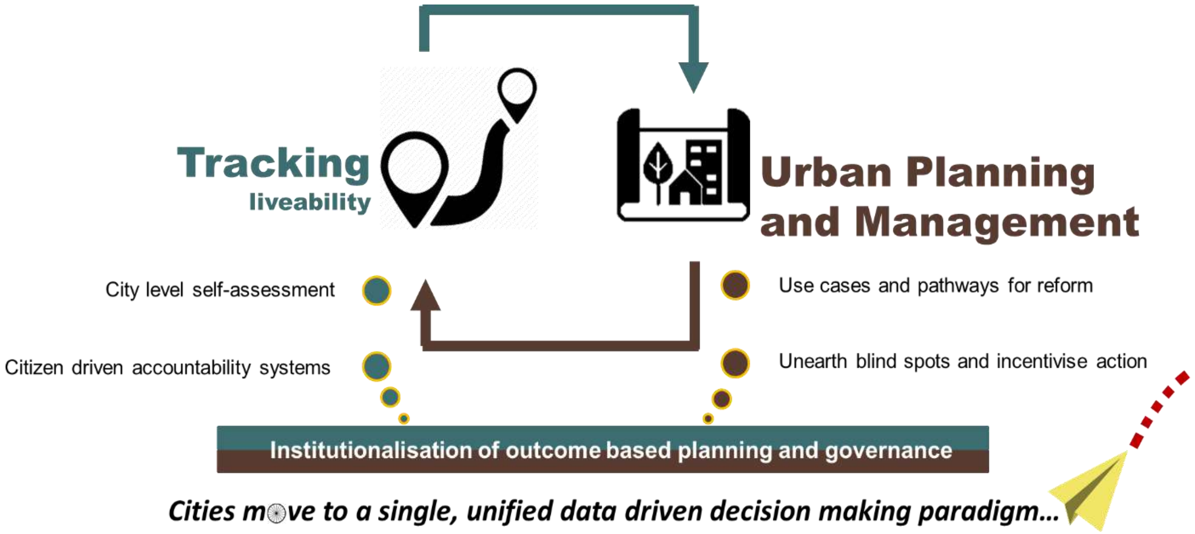
#	Challenges	Proposed Solutions
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

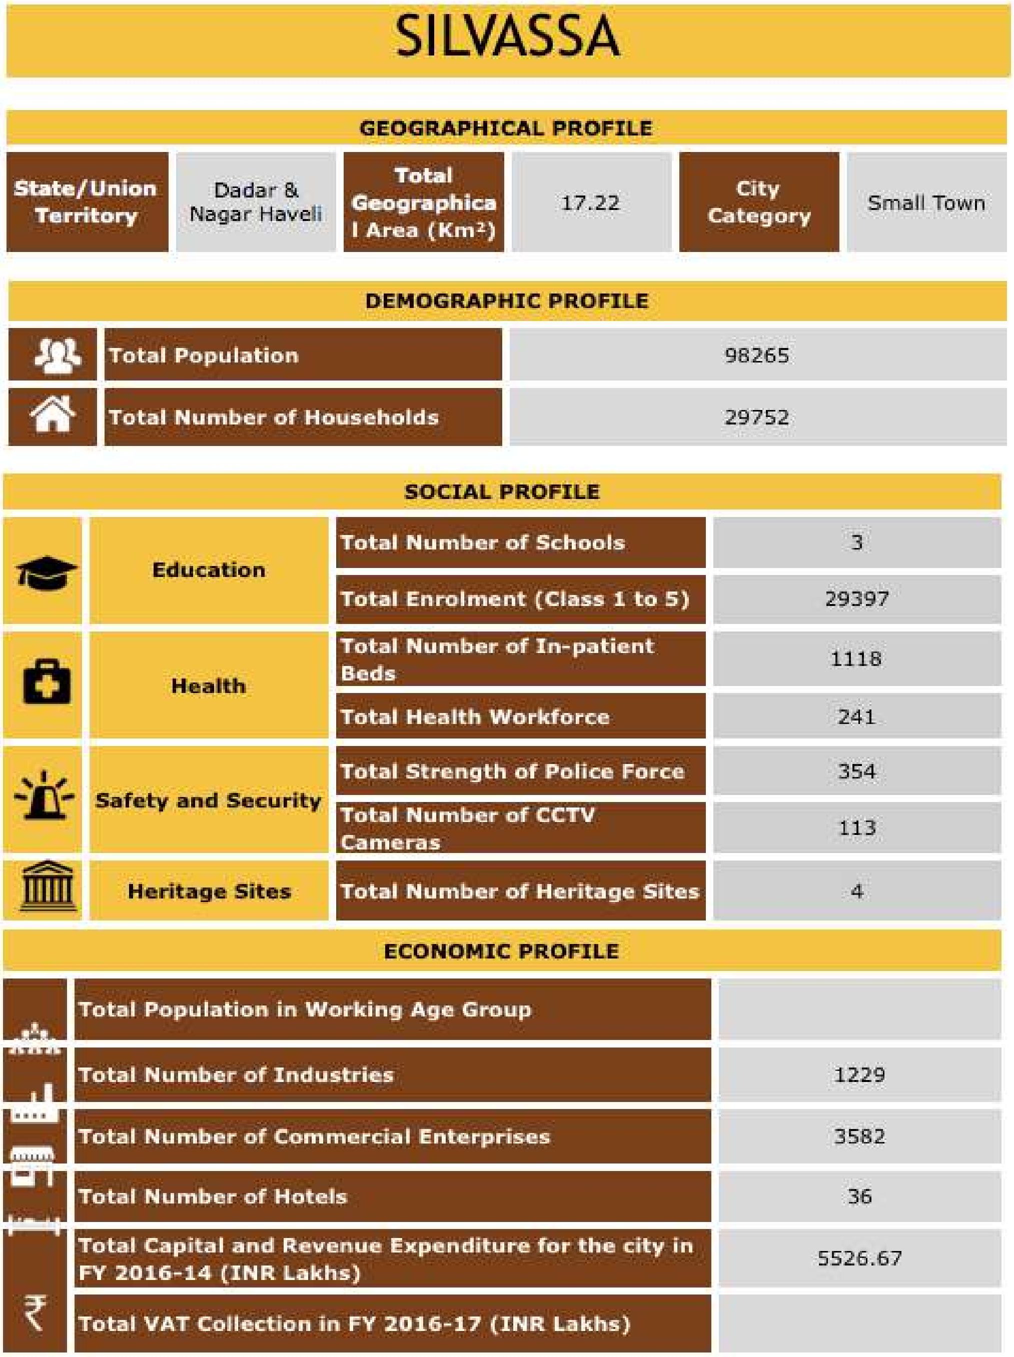


Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SILVASSA

GEOGRAPHICAL PROFILE

State/Union Territory	Dadar & Nagar Haveli	**Total Geographical Area (Km²)**	17.22	**City Category**	Small Town

DEMOGRAPHIC PROFILE

Total Population	98265
Total Number of Households	29752

SOCIAL PROFILE

Education	**Total Number of Schools**	3
	Total Enrolment (Class 1 to 5)	29397
Health	**Total Number of In-patient Beds**	1118
	Total Health Workforce	241
Safety and Security	**Total Strength of Police Force**	354
	Total Number of CCTV Cameras	113
Heritage Sites	**Total Number of Heritage Sites**	4

ECONOMIC PROFILE

Total Population in Working Age Group	
Total Number of Industries	1229
Total Number of Commercial Enterprises	3582
Total Number of Hotels	36
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	5526.67
Total VAT Collection in FY 2016-17 (INR Lakhs)	

PHYSICAL PROFILE

Water	Average Quantity of Water Supplied (MLD)	15
	Total Number of Water Connection	5874
Sanitation Facilities	Total number of households with access to individual toilets in the city	98265
	Total number of households in the city with access to community toilets in the city	
Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	46
	Total number of households covered through door-to-door collection of solid waste	0
Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	0
	Daily average quantum of waste water treated by STPs in the city (MLD)	0
Electricity	Total number of authorized electrical connections in the city	0
	Total electricity supplied to the city (kWh)	637483825
Public and Open Spaces	Total area covered by green spaces in the city (m^2)	
Roads and Transport	Total Length of Road Network in the City (Km)	83.38
	Total length of arterial and sub-arterial road network in the city (Km)	6.5
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	13.58

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indica

tors). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive

development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1. Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration

Pillars of Comprehensive Development	Category	Indicators
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population

Pillars of Comprehensive Development	Category	Indicators
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting

Pillars of Comprehensive Development	Category	Indicators
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters

Pillars of Comprehensive Development	Category	Indicators
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2. Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

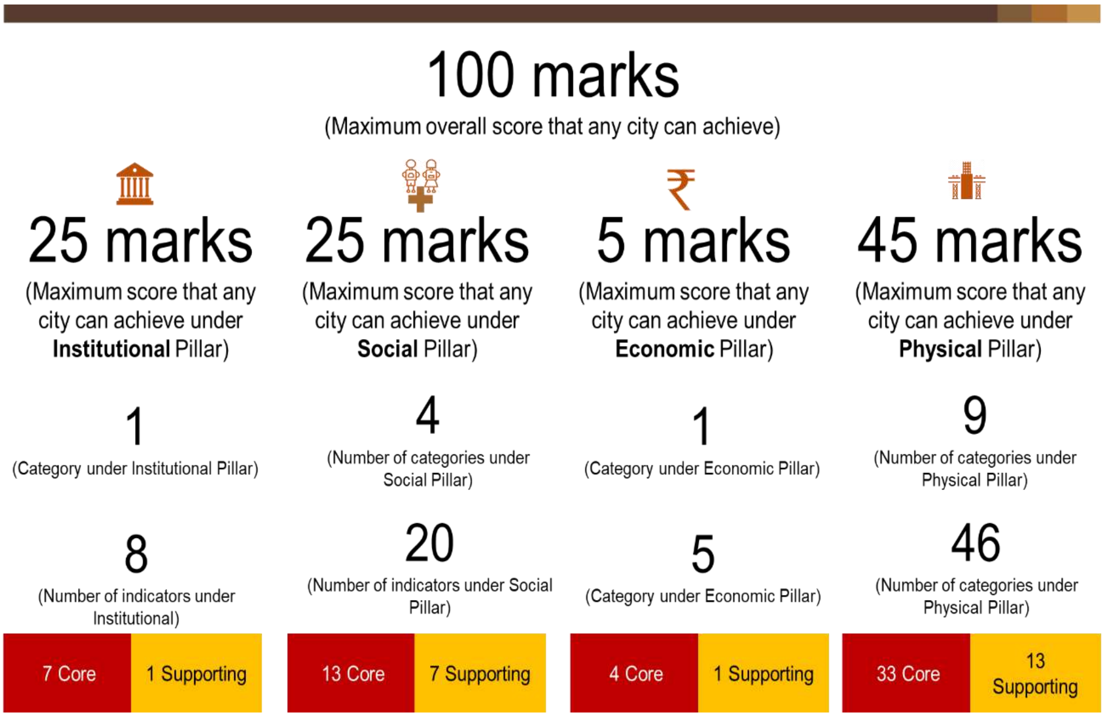
Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million

Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3. Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting

1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4. Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicatorvalueforthecity - indicatorvaluefortheworstperformingcity}{benchmark - indicatorvaluefortheworstperformingcity}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1. Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2. Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and de-

velopment agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Department (Silvassa Municipal Council)
Urban Local Body	For Park and Recreation Related Questions	Forest Department-Silvassa
Urban Local Body	For Water Supply and Drainage related questions	Water Supply and Drainage Department Silvassa Municipal Council-Silvassa
Urban Local Body	For Heritage sites related data	Silvassa Municipal Council-Silvassa
Urban Local Body	For Ecological sites related data	Tourism Department-Silvassa
Urban Local Body	For Housing related data	Housing Department –SMC-Silvassa
Urban Local Body	For Building plan related data	Housing Department –SMC-Silvassa
Urban Local Body	For Roads related data	PWD and Silvassa Municipal Council-Silvassa
Urban Local Body	For Solid waste management related data	Silvassa Municipal Council-Silvassa
Urban Local Body	For IT services related data	Silvassa Municipal Council-Silvassa
Urban Local Body	For Vendor committee related data	Silvassa Municipal Council-Silvassa
Urban Local Body	Any other departments involved in providing data	ULB/SMC-Silvassa

	for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board-Silvassa
Development Authority	Building Infrastructure	Silvassa Municipal Council- Silvassa
	Construction planning	Silvassa Municipal Council- Silvassa
	Green Building	Silvassa Municipal Council- Silvassa
	Rain water harvesting	Silvassa Municipal Council- Silvassa
	Universal Design Principle	Silvassa Municipal Council- Silvassa
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Electricity Board, 66 KV Road-Silvassa
State Disaster management authority		
State Education Department

Traffic and Police De-		

partment		
Transport Authorities	Buses	Transport /RTO- Silvassa, D & NH
	Registered Vehicles	Transport /RTO- Silvassa, D & NH
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Transport /RTO- Silvassa, D & NH

4.3. List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 17 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	3
Traffic and Police Department	2
Development Authority	0
Pollution Control Board	0
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	3
Transport Authority	1
Disaster Management	1

Urban Local Body	3
Total	17

4.4. Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- **5.1**| Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5. Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 1: Category wise scores

Categories	Scores in Percentage
Governance	55.57%
Identity & Culture	52%
Education	64%
Health	37%
Safety & Security	63%
Economy & Employment	18%
Housing & Inclusiveness	0%
Public Open Spaces	0%
Mixed Land Use & Compactness	50%
Power Supply	15%
Transport & Mobility	15%
Assured Water Supply	59%
Waste Water Management	9%
Solid Waste Management	33%
Reduced Pollution	53%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

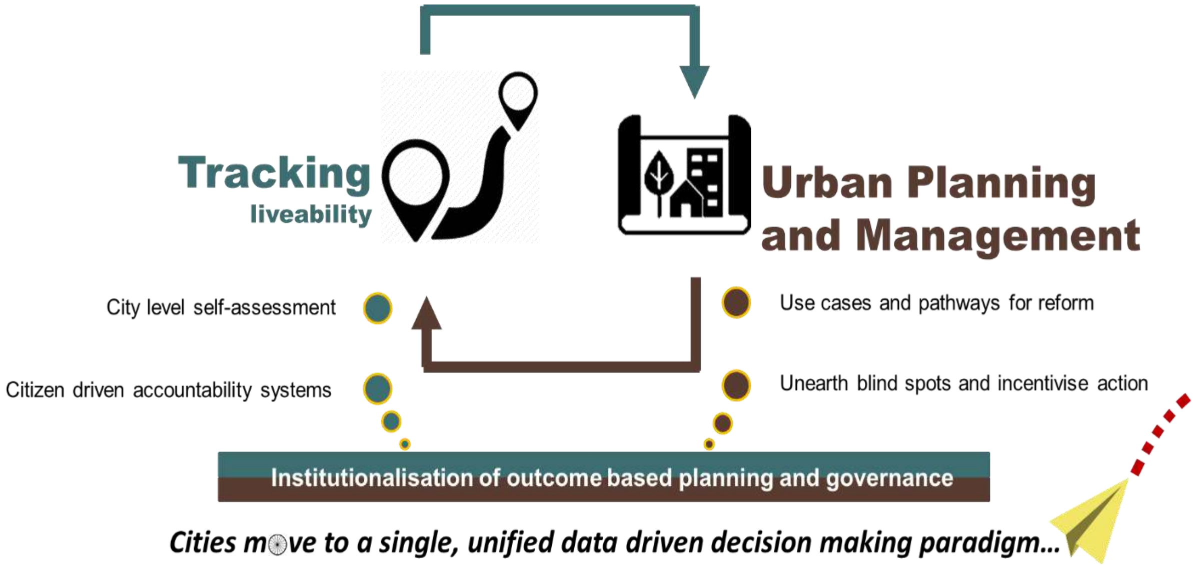
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

SOLAPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km²)**	178.57	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	951558
Total Number of Households	188503

SOCIAL PROFILE

Education	**Total Number of Schools**	420
	Total Enrolment (Class 1 to 5)	70236
Health	**Total Number of In-patients Beds**	6291
	Total Health Workforce	4845
Safety and Security	**Total Strength of Police Force**	2178
	Total Number of CCTV Cameras	14
Heritage Sites	**Total Number of Heritage Sites**	750

ECONOMIC PROFILE

Total Population in Working Age Group	323669
Total Number of Industries	12202
Total Number of Commercial Enterprises	22754
Total Number of Hotels	26
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	7737.54168
Total VAT Collection in FY 2016-17 (INR Lakhs)	31743

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	89.96
		Total Number of Water Connections	104583
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	15663
		Total number of households in the city with access to community toilets in the city	9600
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	250
		Total number of households covered through door-to-door collection of solid waste	151000
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	93.5
		Daily average quantum of waste water treated by STPs in the city (MLD)	60
	Electricity	**Total number of authorized electrical connections in the city**	193475
		Total electricity supplied to the city (kWh)	505977288.6
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	63483400
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1903
		Total length of arterial and sub-arterial road network in the city (Km)	1903
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	37.8

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases

Pillars of Comprehensive Development	Category	Indicators
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation	11.1 Geographical coverage of public transport
		11.2 Availability of public transport

Pillars of Comprehensive Development	Category	Indicators
	and Mobility	11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution

Pillars of Comprehensive Development	Category	Indicators
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	**25 marks** (Maximum score that any city can achieve under **Social** Pillar)	**5 marks** (Maximum score that any city can achieve under **Economic** Pillar)	**45 marks** (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Dept
Urban Local Body	For Park and Recreation Related Questions	Garden Dept
Urban Local Body	For Water Supply and Drainage related questions	Water Supply and Drainage Dept
Urban Local Body	For Heritage sites related data	Smart City Office
Urban Local Body	For Ecological sites related data	Smart City Office
Urban Local Body	For Housing related data	City Engineer Dept
Urban Local Body	For Building plan related data	City Engineer Dept
Urban Local Body	For Roads related data	City Engineer Dept
Urban Local Body	For Solid waste management related data	Solid Waste Management, SMC
Urban Local Body	For IT services related data	Computer Dept., SMC
Urban Local Body	For Vendor committee related data	Market Dept., SMC
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Light Dept., Health Dept., Property Tax Dept., Town Planning Dept., Swachh Maharashtra Mission Office, Land & Real Estate Dept., Sports Officer, Transport Dept., SMC School Board, etc.
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Maharashtra Pollution Control Board, Solapur.
Development Authority	Building Infrastructure	Building Permission Dept.
	Construction planning	Building Permission Dept.
	Green Building	Building Permission Dept.
	Rain water harvesting	Building Permission Dept.
	Universal Design Principle	Building Permission Dept.
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Maharashtra State Electricity Distribution Corporation Limited, Solapur.
State Disaster		Collector Office, Solapur.

Designated data owners	Subcategories	Data owners at city level
management authority		
State Education Department		SMC School Board
State Health Department	Health care professionals	Health Dept., SMC.
	Citizen Services	Health Dept., SMC.
	Disease Prevalence	Health Dept., SMC.
	Health Infrastructure	Health Dept., SMC.
State Renewable Energy Development Agency		Maharashtra State Electricity Distribution Corporation Limited, Solapur.
State Sales / Commercial Taxes Department		GST Office, Solapur.
Town and Country Planning Department	Land Use	Town Planning Dept., SMC
Traffic and Police Department		Commissioner of Police Office, Solapur.
Transport Authorities	Buses	Transport Dept., SMC
	Registered Vehicles	RTO
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 74 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	7
Traffic and Police Department	2
Development Authority	0
Pollution Control Board	2
State Renewable Energy Department	0
Town and Country Planning	0
State Health Department	4
Transport Authority	2
Disaster Management	1
Urban Local Body	54
Total	74*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

6. LA - Passenger Information Systems
7. LA - Street Vendors

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	53.89%
Identity & Culture	23%
Education	75%
Health	99%
Safety & Security	56%
Economy & Employment	41%
Housing & Inclusiveness	0%
Public Open Spaces	55%
Mixed Land Use & Compactness	0%
Power Supply	51%
Transport & Mobility	33%
Assured Water Supply	49%
Waste Water Management	41%
Solid Waste Management	55%
Reduced Pollution	65%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

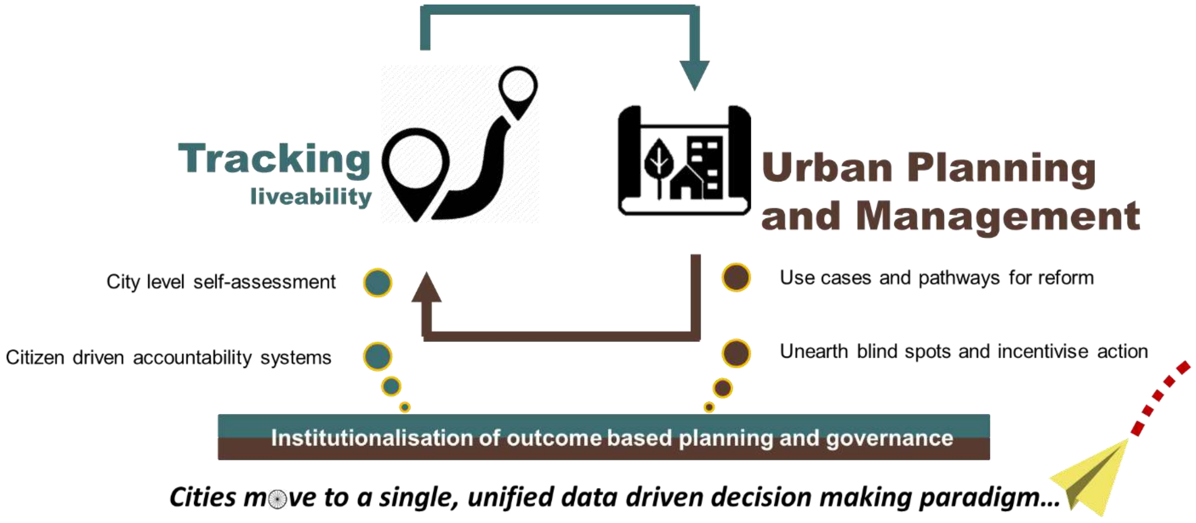
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

SRINAGAR

GEOGRAPHICAL PROFILE

State/Union Territory	Jammu and Kashmir	Total Geographical Area (Km^2)	276	City Category	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1206419
Total Number of Households	206080

SOCIAL PROFILE

Education	Total Number of Schools	67
	Total Enrolment (Class 1 to 5)	10419
Health	Total Number of In-patient Beds	3886
	Total Health Workforce	9986
Safety and Security	Total Strength of Police Force	4670
	Total Number of CCTV Cameras	323
Heritage Sites	Total Number of Heritage Sites	4

ECONOMIC PROFILE

Total Population in Working Age Group	411091
Total Number of Industries	5829
Total Number of Commercial Enterprises	77056
Total Number of Hotels	419
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	15595.04
Total VAT Collection in FY 2016-17 (INR Lakhs)	98411.01

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	113.21
	Total Number of Water Connection	129551
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	1175918
	Total number of households in the city with access to community toilets in the city	30
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	0
	Total number of households covered through door-to-door collection of solid waste	142400
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	53.7
	Daily average quantum of waste water treated by STPs in the city (MLD)	53.7
Electricity	**Total number of authorized electrical connections in the city**	199993
	Total electricity supplied to the city (kWh)	1048025481
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	132480
Roads and Transport	**Total Length of Road Network in the City (Km)**	1908
	Total length of arterial and sub-arterial road network in the city (Km)	560
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

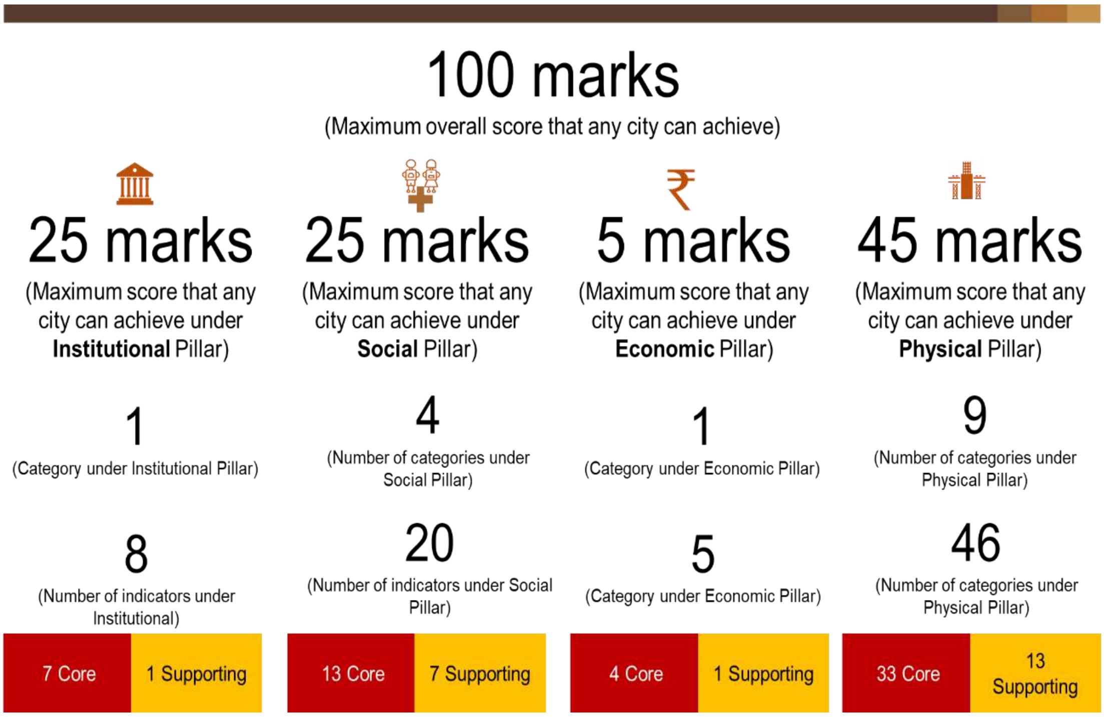
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)
25 marks
(Maximum score that any city can achieve under Institutional Pillar)
25 marks
(Maximum score that any city can achieve under Social Pillar)
5 marks
(Maximum score that any city can achieve under Economic Pillar)
45 marks
(Maximum score that any city can achieve under Physical Pillar)
1
(Category under Institutional Pillar)
4
(Number of categories under Social Pillar)
1
(Category under Economic Pillar)
9
(Number of categories under Physical Pillar)
8
(Number of indicators under Institutional)
20
(Number of indicators under Social Pillar)
5
(Category under Economic Pillar)
46
(Number of categories under Physical Pillar)
7 Core
1 Supporting
13 Core
7 Supporting
4 Core
1 Supporting
33 Core
13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Section, Srinagar Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Srinagar Municipal corporation
Urban Local Body	For Water Supply and Drainage related questions	Srinagar Municipal corporation
Urban Local Body	For Heritage sites related data	Srinagar Municipal Corporation
Urban Local Body	For Ecological sites related data	Srinagar Municipal Corporation
Urban Local Body	For Housing related data	Srinagar Municipal Corporation
Urban Local Body	For Building plan related data	Building Plan Section, Srinagar Municipal Corporation
Urban Local Body	For Roads related data	Public Work section, Srinagar Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid Waste Management Section, Srinagar Municipal Corporation
Urban Local Body	For IT services related data	IT Section, Srinagar Municipal Corporation
Urban Local Body	For Vendor committee related data	Srinagar Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control	Water Quality, Air Quality, Noise Quality	J & KState Pollution Control Board

Designated data owners	Subcategories	Data owners at city level
Board		
Development Authority	Building Infrastructure	Srinagar development authority
	Construction planning	Srinagar development authority
	Green Building	Srinagar development authority
	Rain water harvesting	Srinagar development authority
	Universal Design Principle	Srinagar development authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	J & K State Power Development Corporation
State Disaster management authority		J & K State Disaster Management Authority
State Education Department		District Education Department
State Health Department	Health care professionals	Health Section, Srinagar Municipal Corporation State Health Department
	Citizen Services	Health Section, Srinagar Municipal Corporation
	Disease Prevalence	Health Section, Srinagar Municipal Corporation State Health Department
	Health Infrastructure	State Health Department
State Renewable Energy Development Agency		J & K Energy Development Agency
State Sales / Commercial Taxes Department		Commercial taxes, Kashmir Division
Town and Country Planning Department	Land Use	Town Planning, SMC
Traffic and Police Department		J & K Police department, Srinagar
Transport Authorities	Buses	Transport Department, J & K
	Registered Vehicles	Transport Department, J & K
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA

Designated data owners	Subcategories	Data owners at city level
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 32 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	2
DISCOM/Electricity Department	1
Traffic and Police Department	1
Development Authority	2
Pollution Control Board	2
State Renewable Energy Department	1
Town and Country Planning	1
State Health Department	2
Transport Authority	1
Disaster Management	0
Urban Local Body	18
Total	32*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of

data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

- 1.2 | Percentage of services integrated through Command Centre
- 2.3 | Hotel occupancy
- 3.4 | Percentage of schools with access to digital education
- **5.1**| Number of streets, public places, junctions covered through surveillance systems
- 6.5 | Percentage of vendors registered and provided formal spaces
- 11.7 | Availability of Passenger Information System
- 11.11 | Percentage of traffic intersections with pedestrian crossing facilities
- 11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

- 6.4 | Unemployment Rate
- 11.3 | Mode share of public transport
- 11.5 | Mode share of Non Motorized Transport
- 12.3 | Quality of Water Supplied
- 15.4 | Level of Noise Pollution

4.5 Physical Audit

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	35.68%
Identity & Culture	0%
Education	44%
Health	88%
Safety & Security	69%
Economy & Employment	7%
Housing & Inclusiveness	6%
Public Open Spaces	4%
Mixed Land Use & Compactness	0%
Power Supply	23%
Transport & Mobility	37%
Assured Water Supply	58%
Waste Water Management	50%
Solid Waste Management	27%
Reduced Pollution	28%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

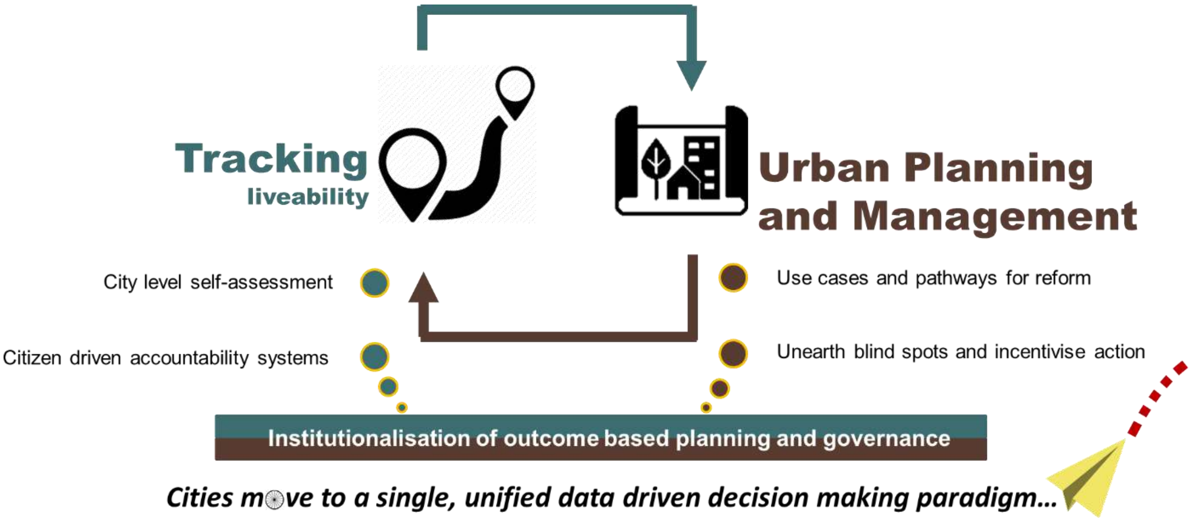
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities

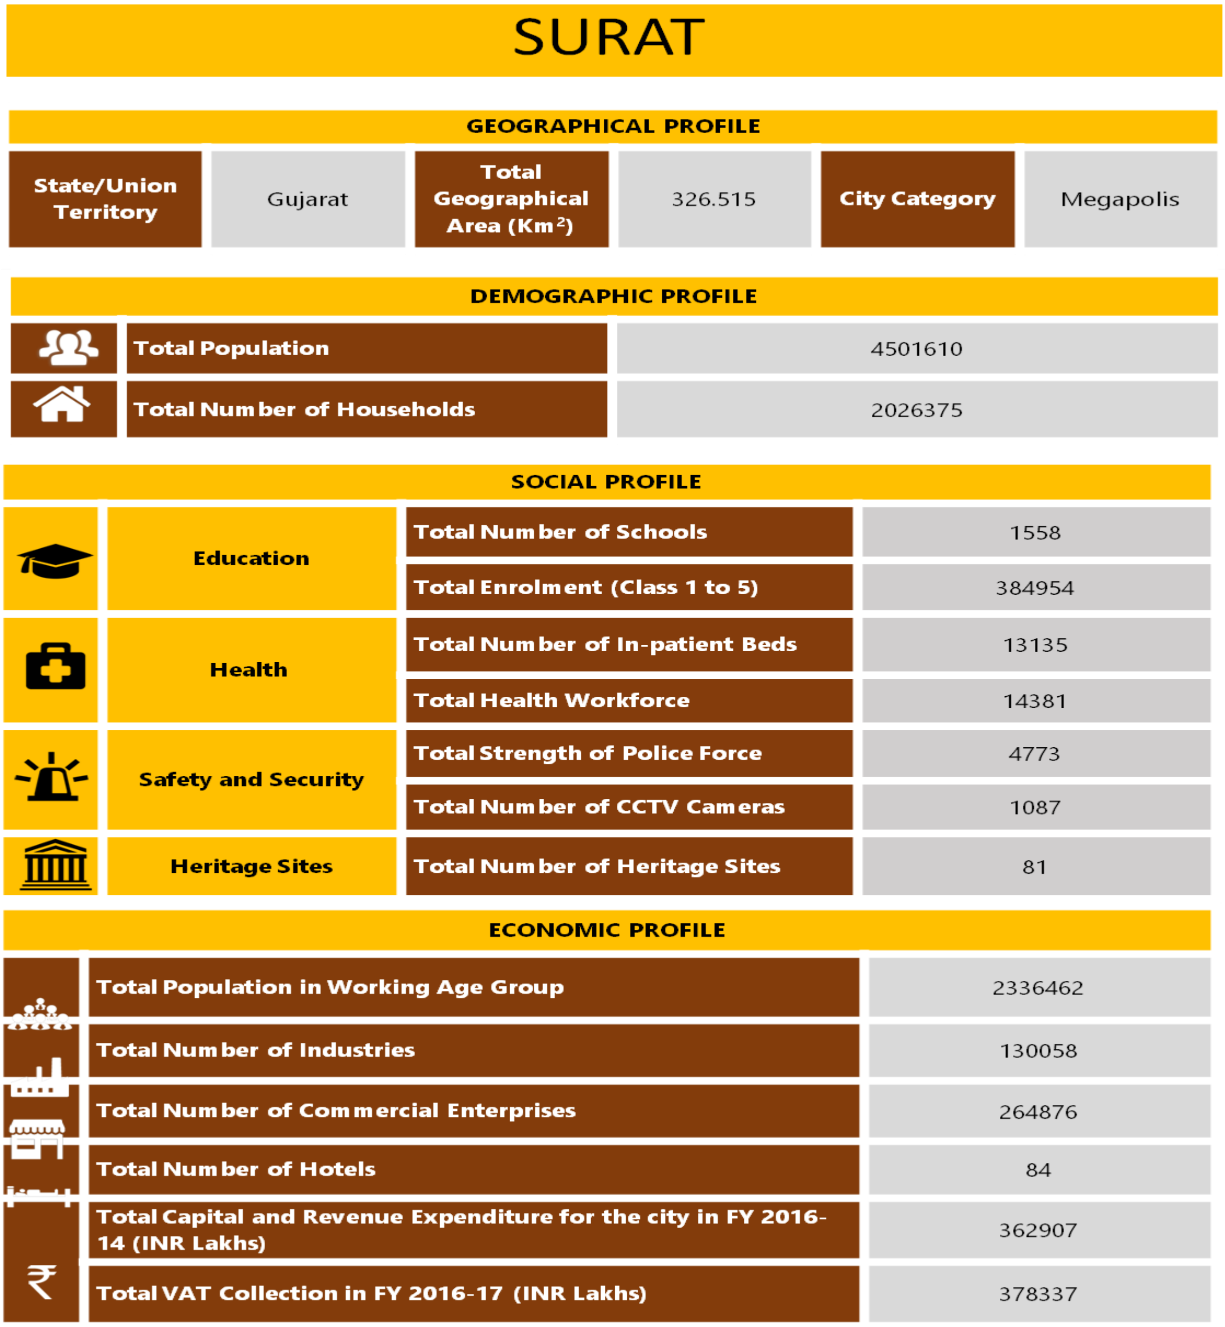


Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



SURAT

GEOGRAPHICAL PROFILE

State/Union Territory	Gujarat	**Total Geographical Area (Km^2)**	326.515	**City Category**	Megapolis

DEMOGRAPHIC PROFILE

Total Population	4501610
Total Number of Households	2026375

SOCIAL PROFILE

Education	**Total Number of Schools**	1558
	Total Enrolment (Class 1 to 5)	384954
Health	**Total Number of In-patient Beds**	13135
	Total Health Workforce	14381
Safety and Security	**Total Strength of Police Force**	4773
	Total Number of CCTV Cameras	1087
Heritage Sites	**Total Number of Heritage Sites**	81

ECONOMIC PROFILE

Total Population in Working Age Group	2336462
Total Number of Industries	130058
Total Number of Commercial Enterprises	264876
Total Number of Hotels	84
Total Capital and Revenue Expenditure for the city in FY 2016-14 (INR Lakhs)	362907
Total VAT Collection in FY 2016-17 (INR Lakhs)	378337

PHYSICAL PROFILE

Water	**Average Quantity of Water Supplied (MLD)**	1065
	Total Number of Water Connection	384266
Sanitation Facilities	**Total number of households with access to individual toilets in the city**	1309286
	Total number of households in the city with access to community toilets in the city	10200
Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	1995
	Total number of households covered through door-to-door collection of solid waste	1311433
Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	756.2
	Daily average quantum of waste water treated by STPs in the city (MLD)	752
Electricity	**Total number of authorized electrical connections in the city**	1312509
	Total electricity supplied to the city (kWh)	6149199231
Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	31452977.17
Roads and Transport	**Total Length of Road Network in the City (Km)**	3983.287
	Total length of arterial and sub-arterial road network in the city (Km)	765.132
	Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	306.897

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in

Pillars of Comprehensive Development	Category	Indicators
		schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density

Pillars of Comprehensive Development	Category	Indicators
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through

Pillars of Comprehensive Development	Category	Indicators
		meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

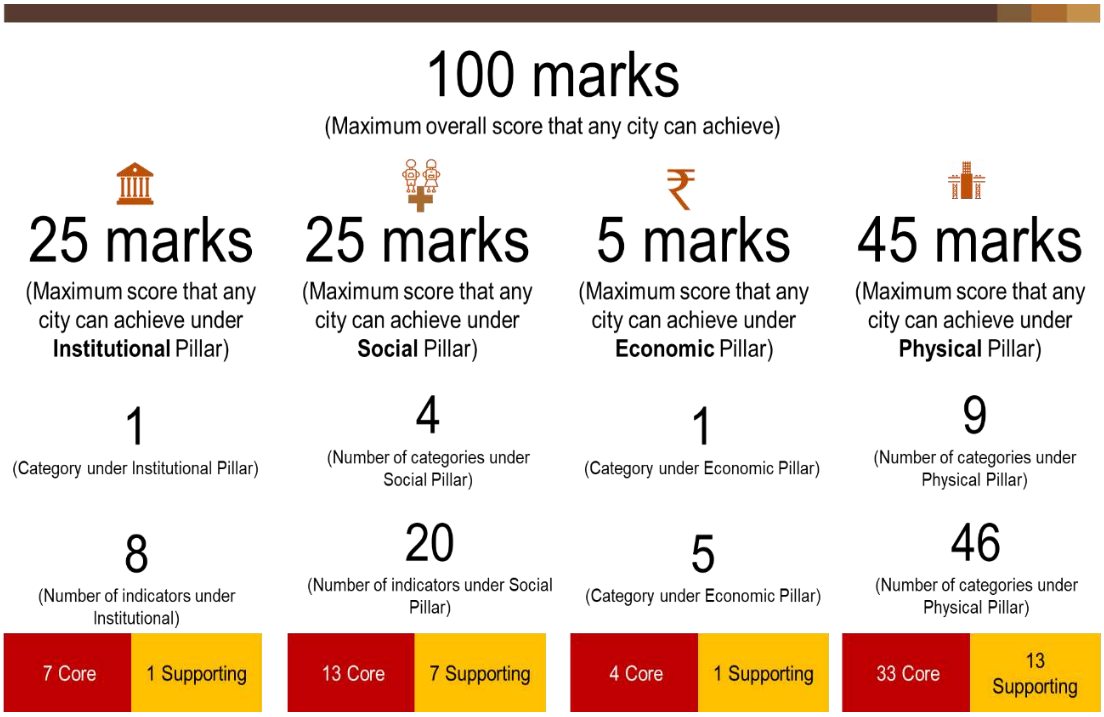
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks
(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark -\ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account
Urban Local Body	For Park and Recreation Related Questions	Garden
Urban Local Body	For Water Supply and Drainage related questions	Drainage department/ hydraulic
Urban Local Body	For Heritage sites related data	Heritage/chief curator
Urban Local Body	For Ecological sites related data	Drainage department
Urban Local Body	For Housing related data	Slum upgradation cell
Urban Local Body	For Building plan related data	TDO
Urban Local Body	For Roads related data	Road development department
Urban Local Body	For Solid waste management related data	Health department
Urban Local Body	For IT services related data	ISD
Urban Local Body	For Vendor committee related data	Town planning
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Gujarat pollution control Board
Development Authority	Building Infrastructure	TDO
	Construction planning	TDO

Designated data owners	Subcategories	Data owners at city level
	Green Building	TDO
	Rain water harvesting	TDO
	Universal Design Principle	TDO
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Torrent power and Dakshin Gujarat Vij Company Limited
State Disaster management authority		CFO
State Education Department		Education department
State Health Department	Health care professionals	Health department
	Citizen Services	Health department
	Disease Prevalence	Health department
	Health Infrastructure	Health department
State Renewable Energy Development Agency		EEC
State Sales / Commercial Taxes Department		state tax joint commissioner office
Town and Country Planning Department	Land Use	Town planning
Traffic and Police Department		Traffic cell
Transport Authorities	Buses	BRTS, sitelink
	Registered Vehicles	Traffic
	Sub urban rail transport	-
	Mono Rail Authority	-
	Tramways	-
	Marine Transport Authority	-

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 95 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register,

signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	1
State Education Department	1
DISCOM/Electricity Department	3
Traffic and Police Department	3
Development Authority	13
Pollution Control Board	3
State Renewable Energy Department	2
Town and Country Planning	0
State Health Department	9
Transport Authority	1
Disaster Management	1
Urban Local Body	58
Total	95*

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1 | Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	75.17%
Identity & Culture	51%
Education	82%
Health	75%
Safety & Security	56%
Economy & Employment	41%
Housing & Inclusiveness	59%
Public Open Spaces	31%

Mixed Land Use & Compactness	38%
Power Supply	37%
Transport & Mobility	34%
Assured Water Supply	89%
Waste Water Management	73%
Solid Waste Management	81%
Reduced Pollution	78%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

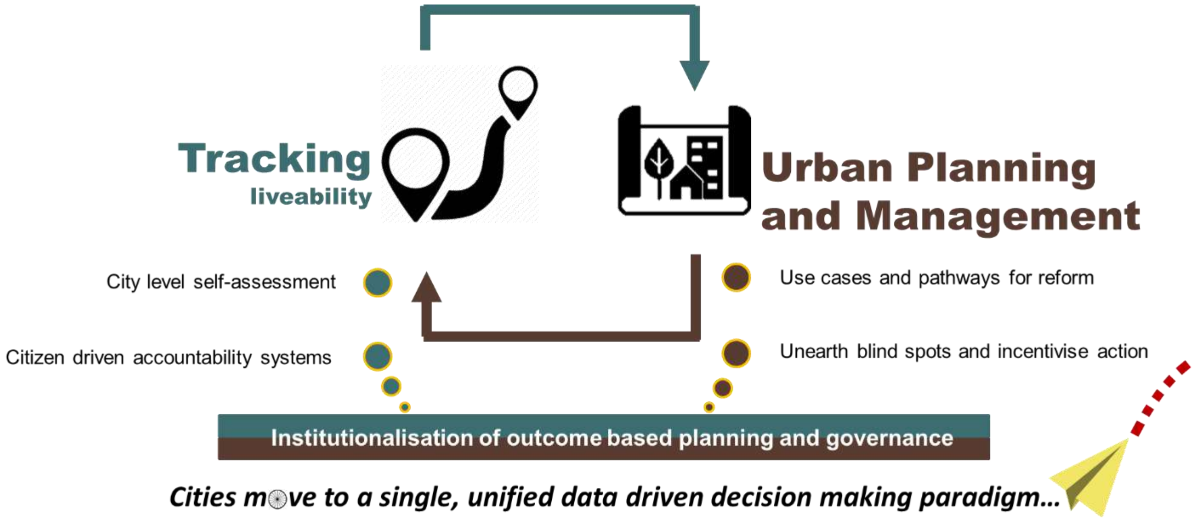
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

THANE

GEOGRAPHICAL PROFILE

State/Union Territory	Maharashtra	**Total Geographical Area (Km^2)**	128.23	**City Category**	Metropolis

DEMOGRAPHIC PROFILE

Total Population	1841488
Total Number of Households	513225

SOCIAL PROFILE

Education	**Total Number of Schools**	818
	Total Enrolment (Class 1 to 5)	171583
Health	**Total Number of In-patients Beds**	6341
	Total Health Workforce	8168
Safety and Security	**Total Strength of Police Force**	1751
	Total Number of CCTV Cameras	92
Heritage Sites	**Total Number of Heritage Sites**	7

ECONOMIC PROFILE

	Total Population in Working Age Group	1667269
	Total Number of Industries	16962
	Total Number of Commercial Enterprises	40341
	Total Number of Hotels	22
₹	**Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)**	200661.86
	Total VAT Collection in FY 2016-17 (INR Lakhs)	96747.03681

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	480
		Total Number of Water Connections	134773
	Sanitation Facilities	Total number of households with access to individual toilets in the city	409394
		Total number of households in the city with access to community toilets in the city	71009
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	696
		Total number of households covered through door-to-door collection of solid waste	430336
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	325
		Daily average quantum of waste water treated by STPs in the city (MLD)	66
	Electricity	Total number of authorized electrical connections in the city	950723
		Total electricity supplied to the city (kWh)	3531520000
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	512593
	Roads and Transport	Total Length of Road Network in the City (Km)	427.512
		Total length of arterial and sub-arterial road network in the city (Km)	51.27
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	634.8

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 🟥 | 1 Supporting 🟨	13 Core 🟥 | 7 Supporting 🟨	4 Core 🟥 | 1 Supporting 🟨	33 Core 🟥 | 13 Supporting 🟨

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Garden department
Urban Local Body	For Water Supply and Drainage related questions	Water supply department
Urban Local Body	For Heritage sites related data	Town planning department
Urban Local Body	For Ecological sites related data	Garden department
Urban Local Body	For Housing related data	Housing department
Urban Local Body	For Building plan related data	City engineer and town planning department
Urban Local Body	For Roads related data	City engineer department/ pwd dept
Urban Local Body	For Solid waste management related data	Solid waste management department
Urban Local Body	For IT services related data	It department
Urban Local Body	For Vendor committee related data	Encroachment department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Employment exchange department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Water department and environment department, mpcb
Development Authority	Building Infrastructure	City engineer and town planning department
	Construction planning	Pwd department
	Green Building	Town planning department
	Rain water harvesting	Town planning department
	Universal Design Principle	City engineering department
DISCOM/Electricity	Electrical Connection/	Electricity department

Designated data owners	Subcategories	Data owners at city level
Board	Grievance Redressal/ Power supply	
State Disaster management authority		Disaster management department
State Education Department		Education department
State Health Department	Health care professionals	Health department
	Citizen Services	Health department
	Disease Prevalence	Health department
	Health Infrastructure	Health department
State Renewable Energy Development Agency		Electricity department
State Sales / Commercial Taxes Department		Sales tax department
Town and Country Planning Department	Land Use	Town planning department
Traffic and Police Department		Disaster management department
Transport Authorities	Buses	Transport department
	Registered Vehicles	Transport department (rto)
	Sub urban rail transport	Transport department
	Mono Rail Authority	Transport department
	Tramways	Transport department
	Marine Transport Authority	Transport department

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 200 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**7**
DISCOM/Electricity Department	**0**
Traffic and Police Department	**14**
Development Authority	**2**
Pollution Control Board	**11**
State Renewable Energy Department	**2**
Town and Country Planning	**1**
State Health Department	**14**
Transport Authority	**28**
Disaster Management	**0**
Urban Local Body	**119**
Total	**200***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use &

compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	53.10%
Identity & Culture	57%
Education	89%
Health	93%
Safety & Security	58%
Economy & Employment	39%
Housing & Inclusiveness	49%
Public Open Spaces	1%
Mixed Land Use & Compactness	12%
Power Supply	59%
Transport & Mobility	87%
Assured Water Supply	90%
Waste Water Management	74%
Solid Waste Management	81%
Reduced Pollution	75%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don’t have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.

#	Challenges	Proposed Solutions
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.

#	Challenges	Proposed Solutions
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.

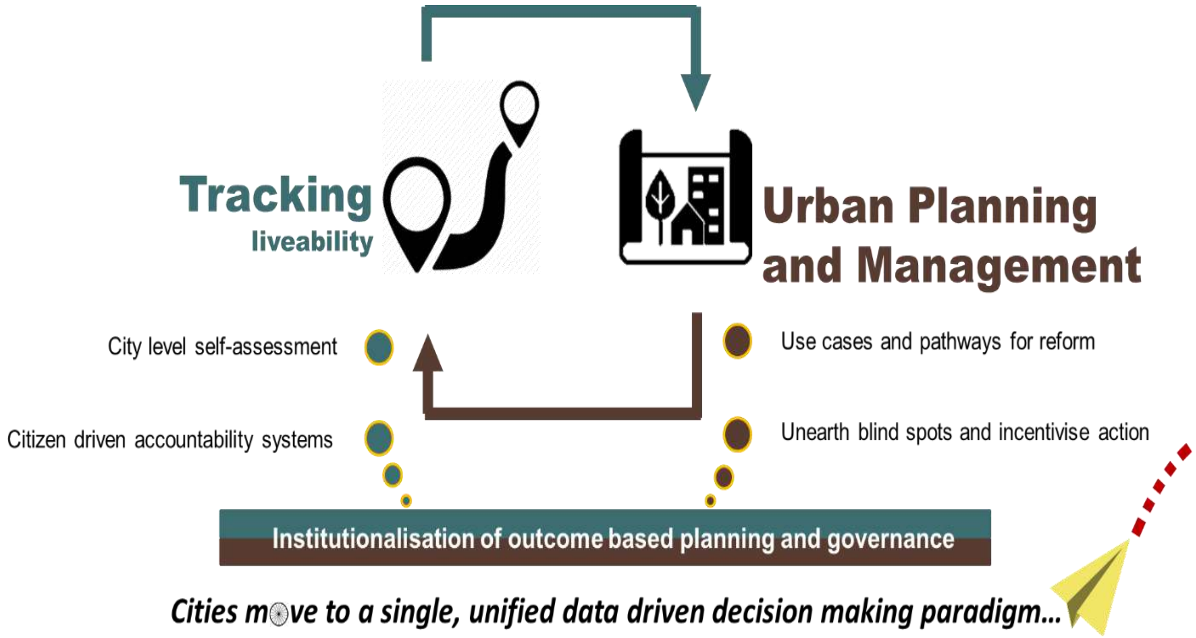
#	Challenges	Proposed Solutions
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

THANJAVUR

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km^2)**	36.33	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	222943
Total Number of Households	46671

SOCIAL PROFILE

Education	**Total Number of Schools**	122
	Total Enrolment (Class 1 to 5)	16821
Health	**Total Number of In-patients Beds**	2407
	Total Health Workforce	16
Safety and Security	**Total Strength of Police Force**	202
	Total Number of CCTV Cameras	442
Heritage Sites	**Total Number of Heritage Sites**	35

ECONOMIC PROFILE

Total Population in Working Age Group	159277
Total Number of Industries	...
Total Number of Commercial Enterprises	8995
Total Number of Hotels	58
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	7902.75
Total VAT Collection in FY 2016-17 (INR Lakhs)	8273.28

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	27
		Total Number of Water Connections	27961
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	50146
		Total number of households in the city with access to community toilets in the city	1336
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	119
		Total number of households covered through door-to-door collection of solid waste	50263
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	16
		Daily average quantum of waste water treated by STPs in the city (MLD)	16
	Electricity	**Total number of authorized electrical connections in the city**	81578
		Total electricity supplied to the city (kWh)	82410
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	…
	Roads and Transport	**Total Length of Road Network in the City (Km)**	320.441
		Total length of arterial and sub-arterial road network in the city (Km)	320.441
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	…

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Pillars of Comprehensive Development	Category	Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

Pillars of Comprehensive Development	Category	Indicators
		reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

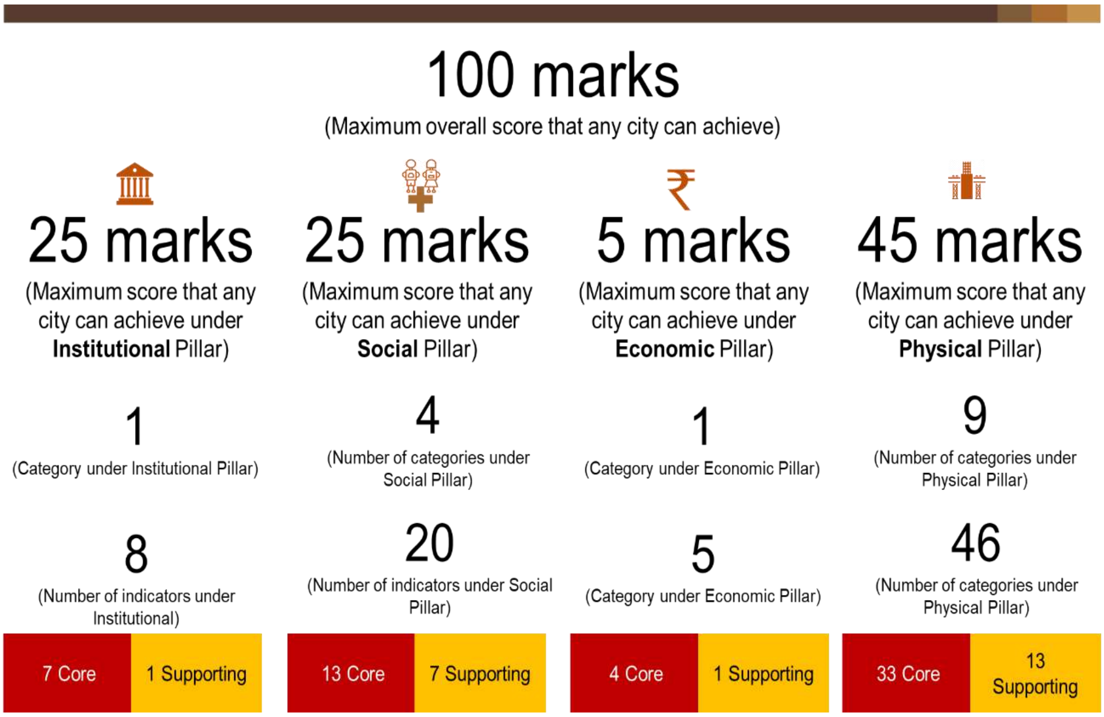
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department, Thanjavur Corporation
Urban Local Body	For Park and Recreation Related Questions	Engineering Section Thanjavur Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section, Thanjavur Corporation
Urban Local Body	For Heritage sites related data	
Urban Local Body	For Ecological sites related data	District Forest Department
Urban Local Body	For Housing related data	Town planning, Thanjavur Corporation
Urban Local Body	For Building plan related data	Town planning, Thanjavur Corporation
Urban Local Body	For Roads related data	Engineering Section, Public Work Department
Urban Local Body	For Solid waste management related data	Health Department , ULB , Thanjavur corporation
Urban Local Body	For IT services related data	IT department, Thanjavur Corporation
Urban Local Body	For Vendor committee related data	Town planning, Thanjavur Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Revenue Section Thanjavur Corporation
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	
Development Authority	Building Infrastructure	Local Planning Authority
	Construction planning	Local Planning Authority
	Green Building	Local Planning Authority
	Rain water harvesting	Local Planning Authority
	Universal Design Principle	Local Planning Authority
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board , Thanjavur
State Disaster management authority		District Disaster Management Department
State Education Department		District Education Department , Thanjavur

Designated data owners	Subcategories	Data owners at city level
State Health Department	Health care professionals	Joint Director, Health Services, Thanjavur
	Citizen Services	Joint Director, Health Services, Thanjavur
	Disease Prevalence	Joint Director, Health Services, Thanjavur
	Health Infrastructure	Joint Director, Health Services, Thanjavur
State Renewable Energy Development Agency		
State Sales / Commercial Taxes Department		District Commercial Tax Department, Thanjavur
Town and Country Planning Department	Land Use	Town planning, Thanjavur Corporation
Traffic and Police Department		Police Department, Thanjavur
Transport Authorities	Buses	Tamilnadu State Transport Corporation, Thanjavur
	Registered Vehicles	Regional Transport Office, Thanjavur
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 114 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

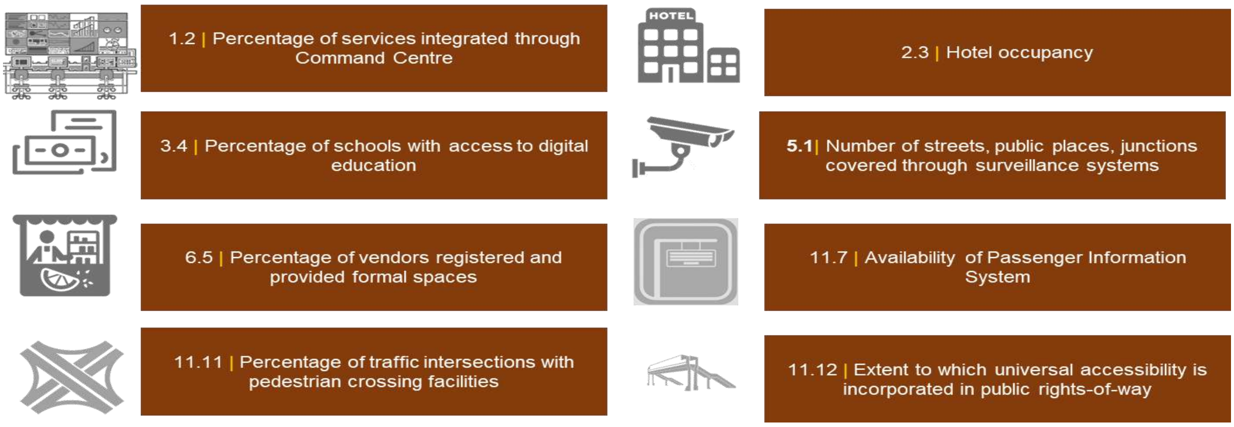
Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**3**
DISCOM/Electricity Department	**6**
Traffic and Police Department	**3**
Development Authority	**5**

Pollution Control Board	**0**
State Renewable Energy Department	**0**
Town and Country Planning	**4**
State Health Department	**0**
Transport Authority	**3**
Disaster Management	**0**
Urban Local Body	**89**
Total	**114***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:



1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

7. LA - Street Vendors
8. LA - Universal Design Principles

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	53.19%
Identity & Culture	8%
Education	90%
Health	88%
Safety & Security	70%
Economy & Employment	33%
Housing & Inclusiveness	2%
Public Open Spaces	3%
Mixed Land Use & Compactness	34%
Power Supply	55%
Transport & Mobility	38%
Assured Water Supply	75%
Waste Water Management	65%
Solid Waste Management	63%
Reduced Pollution	60%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

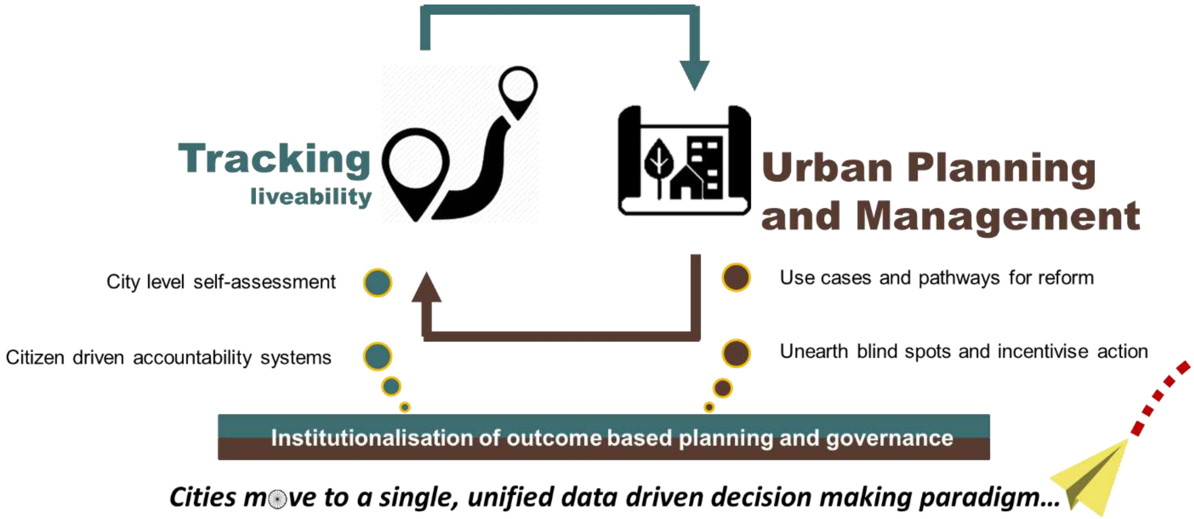
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including

smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

TIRUCHIRAPPALLI

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km^2)**	167.23	**City Category**	Large City

DEMOGRAPHIC PROFILE

Total Population	847387
Total Number of Households	227675

SOCIAL PROFILE

Education	**Total Number of Schools**	367
	Total Enrolment (Class 1 to 5)	169009
Health	**Total Number of In-patients Beds**	6212
	Total Health Workforce	5918
Safety and Security	**Total Strength of Police Force**	1648
	Total Number of CCTV Cameras	560
Heritage Sites	**Total Number of Heritage Sites**	1

ECONOMIC PROFILE

Total Population in Working Age Group	61552
Total Number of Industries	935
Total Number of Commercial Enterprises	21128
Total Number of Hotels	151
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	55480.3
Total VAT Collection in FY 2016-17 (INR Lakhs)	100259.84

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	110
		Total Number of Water Connections	108445
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	160456
		Total number of households in the city with access to community toilets in the city	55626
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	450
		Total number of households covered through door-to-door collection of solid waste	230033
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	58
		Daily average quantum of waste water treated by STPs in the city (MLD)	58
	Electricity	**Total number of authorized electrical connections in the city**	392566
		Total electricity supplied to the city (kWh)	293.69
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	341876.48
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1411.97
		Total length of arterial and sub-arterial road network in the city (Km)	183.24
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	38.74

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various ‘Category Sub-Indexes’ and a composite ‘City Liveability Index’ will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

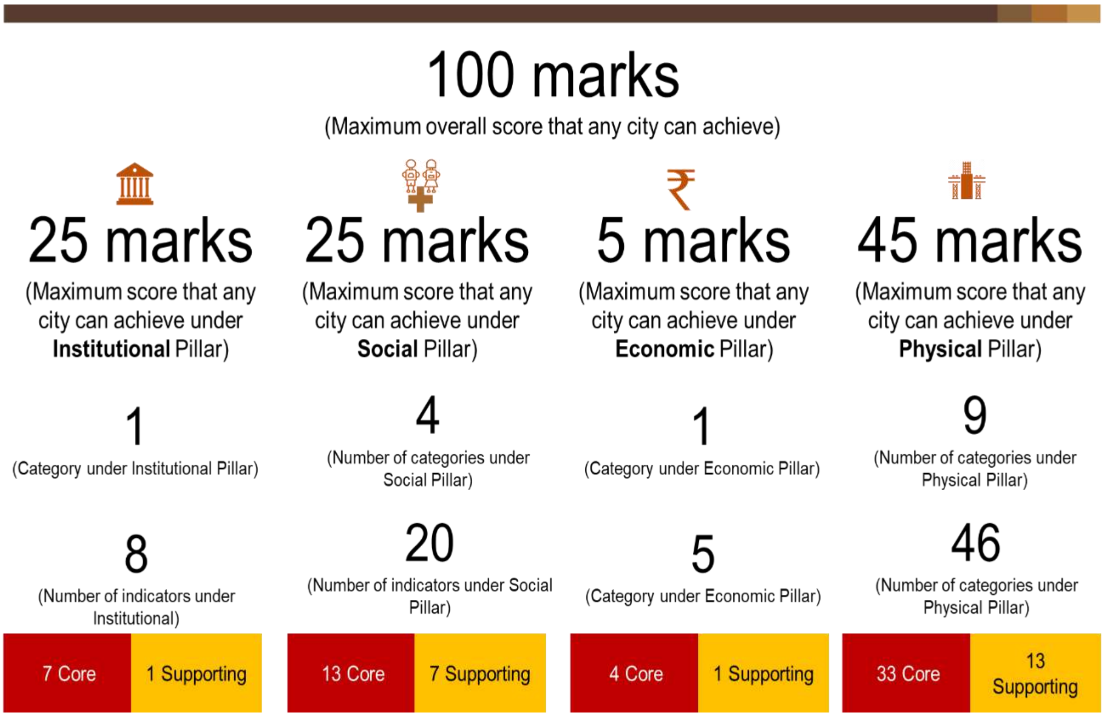
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1	4	1	9
(Category under Institutional Pillar)	(Number of categories under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
8	20	5	46
(Number of indicators under Institutional)	(Number of indicators under Social Pillar)	(Category under Economic Pillar)	(Number of categories under Physical Pillar)
7 Core | 1 Supporting	13 Core | 7 Supporting	4 Core | 1 Supporting	33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts department
Urban Local Body	For Park and Recreation Related Questions	Engineering Section
Urban Local Body	For Water Supply and Drainage related questions	Engineering Section
Urban Local Body	For Heritage sites related data	Town planning
Urban Local Body	For Ecological sites related data	Town planning
Urban Local Body	For Housing related data	Town planning
Urban Local Body	For Building plan related data	Town planning
Urban Local Body	For Roads related data	Engineering Section
Urban Local Body	For Solid waste management related data	Health Department
Urban Local Body	For IT services related data	IT department
Urban Local Body	For Vendor committee related data	Town planning
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Revenue Section
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board, Collectorate, Tiruchirappalli.
Development Authority	Building Infrastructure	Town planning

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Town planning
	Green Building	Town planning
	Rain water harvesting	Town planning
	Universal Design Principle	Engineering Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		Revenue and Disaster Management Department
State Education Department		Education Department
State Health Department	Health care professionals	City Health Office
	Citizen Services	City Health Office
	Disease Prevalence	City Health Office
	Health Infrastructure	City Health Office
State Renewable Energy Development Agency		Tamilnadu Electricity Board
State Sales / Commercial Taxes Department		District Commercial Tax Department
Town and Country Planning Department	Land Use	Town Planning
Traffic and Police Department		Police Department
Transport Authorities	Buses	Tamilnadu State Transport Corporation
	Registered Vehicles	Regional Transport Office
	Sub urban rail transport	NA
	Mono Rail Authority	NA
	Tramways	NA
	Marine Transport Authority	NA

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 170 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**4**
DISCOM/Electricity Department	**8**
Traffic and Police Department	**1**
Development Authority	**12**
Pollution Control Board	**1**
State Renewable Energy Department	**1**
Town and Country Planning	**3**
State Health Department	**8**
Transport Authority	**9**
Disaster Management	**1**
Urban Local Body	**63**
Total	**113***

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	44.38%
Identity & Culture	76%
Education	81%
Health	99%
Safety & Security	62%
Economy & Employment	28%
Housing & Inclusiveness	21%
Public Open Spaces	3%
Mixed Land Use & Compactness	22%
Power Supply	65%
Transport & Mobility	30%
Assured Water Supply	81%
Waste Water Management	56%
Solid Waste Management	99%
Reduced Pollution	99%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

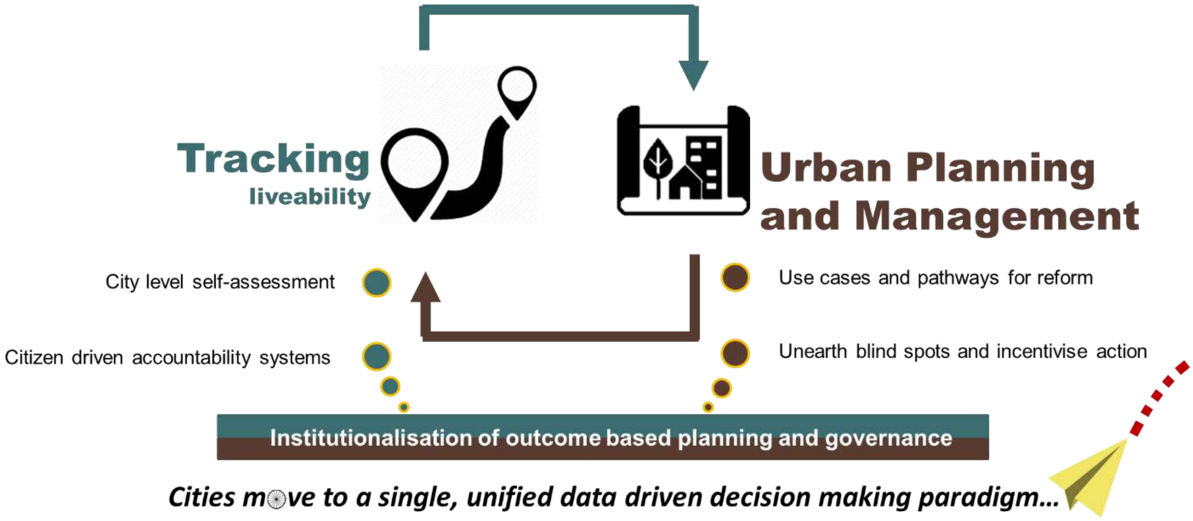
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance
Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

TIRUNELVELI

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km²)**	109	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	473637
Total Number of Households	152339

SOCIAL PROFILE

Education	**Total Number of Schools**	227
	Total Enrolment (Class 1 to 5)	36272
Health	**Total Number of In-patients Beds**	120
	Total Health Workforce	739
Safety and Security	**Total Strength of Police Force**	1206
	Total Number of CCTV Cameras	63
Heritage Sites	**Total Number of Heritage Sites**	4

ECONOMIC PROFILE

Total Population in Working Age Group	147153
Total Number of Industries	490
Total Number of Commercial Enterprises	11008
Total Number of Hotels	26
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	25420
Total VAT Collection in FY 2016-17 (INR Lakhs)	28157.9

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	48
		Total Number of Water Connections	70773
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	105478
		Total number of households in the city with access to community toilets in the city	213
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	150
		Total number of households covered through door-to-door collection of solid waste	159628
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	44.11
		Daily average quantum of waste water treated by STPs in the city (MLD)	8
	Electricity	**Total number of authorized electrical connections in the city**	225243
		Total electricity supplied to the city (kWh)	392910839
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	11850
	Roads and Transport	**Total Length of Road Network in the City (Km)**	128
		Total length of arterial and sub-arterial road network in the city (Km)	1136
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	20.8

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital

Pillars of Comprehensive Development	Category	Indicators
		education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

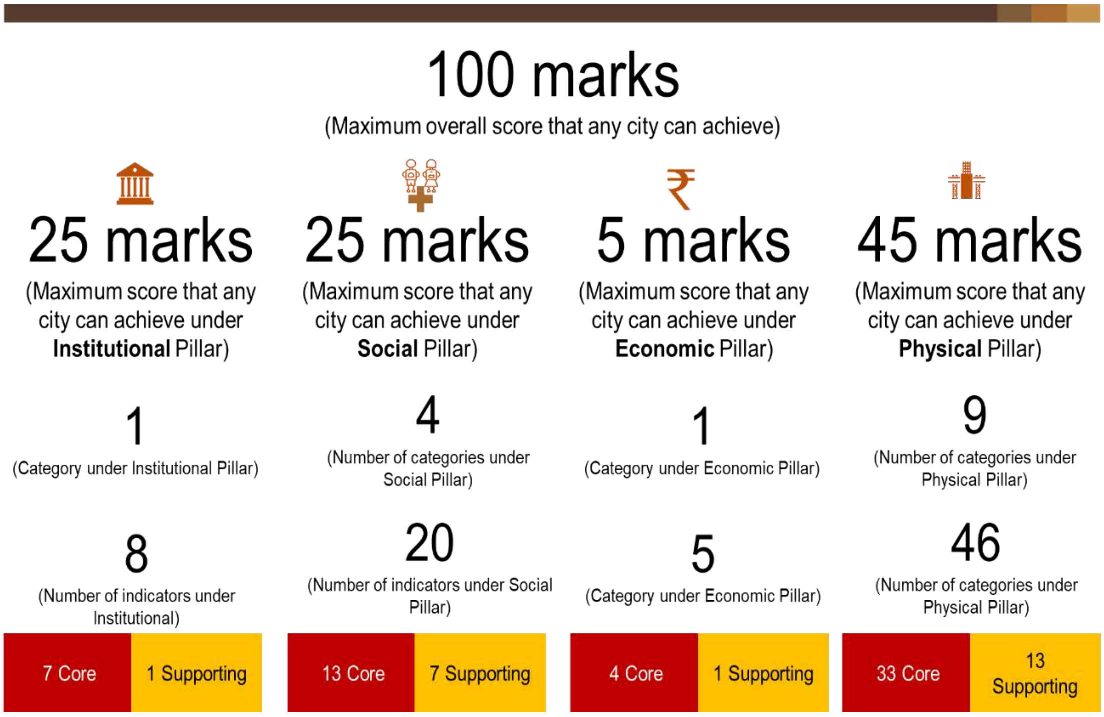
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to "maximum within the comparison group" or "absolute benchmarks". For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and

development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	ULB – Account section
Urban Local Body	For Park and Recreation Related Questions	Town and country Planning Department
Urban Local Body	For Water Supply and Drainage related questions	ULB – Development Authority – Engineering
Urban Local Body	For Heritage sites related data	ULB – Development Authority - Engineering
Urban Local Body	For Ecological sites related data	ULB – Development Authority - Engineering
Urban Local Body	For Housing related data	Town and Country Planning Department
Urban Local Body	For Building plan related data	Town and Country Planning Department
Urban Local Body	For Roads related data	ULB – Development Authority Department
Urban Local Body	For Solid waste management related data	ULB – Health Department
Urban Local Body	For IT services related data	ULB – Information technical section
Urban Local Body	For Vendor committee related data	ULB – Health Department
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Tourism Department, revenue department
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State pollution control Board – Tirunelveli District Sipco - pettai
Development Authority	Building Infrastructure	ULB – Development Authority - Engineering

Designated data owners	Subcategories	Data owners at city level
	Construction planning	Town and country planning Department
	Green Building	Town and country planning department
	Rain water harvesting	Town and country planning Department
	Universal Design Principle	Health Department
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		Central command control center – Disaster Management – Revenue department – Collector office
State Education Department		Chief Educational Officer - Tirunelveli
State Health Department	Health care professionals	ULB – Health Department
	Citizen Services	ULB – Health Department
	Disease Prevalence	Joint Director of Health Services through ULB Health Department
	Health Infrastructure	Joint Director of Health Services through ULB Health Department
State Renewable Energy Development Agency		Tamilnadu Electricity Board - Tirunelveli
State Sales / Commercial Taxes Department		District sales / commercial Tax office – deputy commissioner - Tirunelveli
Town and Country Planning Department	Land Use	Town and country Planning Department
Traffic and Police Department		City police commissioner office –Traffic and Crime – police Department
Transport Authorities	Buses	Tamilnadu state transport corporation
	Registered Vehicles	Regional Transporting Office - Tirunelveli
	Sub urban rail transport	Not applicable
	Mono Rail Authority	Not applicable
	Tramways	Not applicable
	Marine Transport Authority	Not applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 73 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**2**
State Education Department	**1**
DISCOM/Electricity Department	**5**
Traffic and Police Department	**6**
Development Authority	**4**
Pollution Control Board	**4**
State Renewable Energy Department	**1**
Town and Country Planning	**2**
State Health Department	**7**
Transport Authority	**6**
Disaster Management	**1**
Urban Local Body	**34**
Total	**73***

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5 City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	62.00%
Identity & Culture	71%
Education	81%
Health	72%
Safety & Security	70%
Economy & Employment	17%
Housing & Inclusiveness	37%
Public Open Spaces	0%
Mixed Land Use & Compactness	0%
Power Supply	62%
Transport & Mobility	33%
Assured Water Supply	75%
Waste Water Management	83%
Solid Waste Management	88%
Reduced Pollution	40%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78

#	Challenges	Proposed Solutions
	data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.

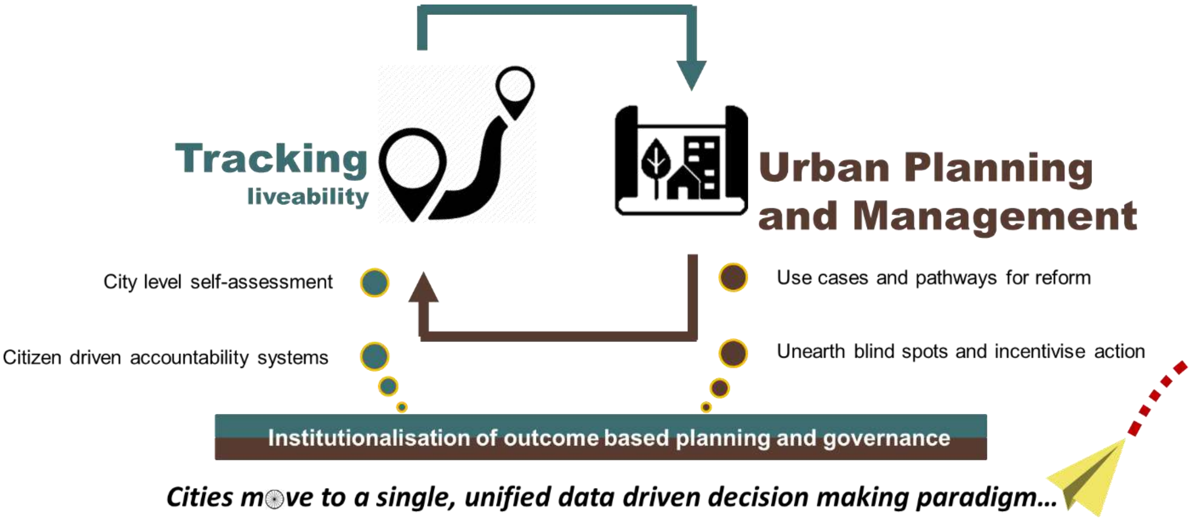
#	Challenges	Proposed Solutions
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm...

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

TIRUPATI

GEOGRAPHICAL PROFILE

State/Union Territory	Andhra Pradesh	**Total Geographical Area (Km^2)**	27.44	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	295323
Total Number of Households	100992

SOCIAL PROFILE

Education	**Total Number of Schools**	335
	Total Enrolment (Class 1 to 5)	32827
Health	**Total Number of In-patients Beds**	5500
	Total Health Workforce	2028
Safety and Security	**Total Strength of Police Force**	1700
	Total Number of CCTV Cameras	256
Heritage Sites	**Total Number of Heritage Sites**	...

ECONOMIC PROFILE

Total Population in Working Age Group	151344
Total Number of Industries	...
Total Number of Commercial Enterprises	11972
Total Number of Hotels	174
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	15722.17
Total VAT Collection in FY 2016-17 (INR Lakhs)	17062.17

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	48
		Total Number of Water Connections	43422
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	62302
		Total number of households in the city with access to community toilets in the city	120
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	219
		Total number of households covered through door-to-door collection of solid waste	103288
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	40.69
		Daily average quantum of waste water treated by STPs in the city (MLD)	29.5
	Electricity	**Total number of authorized electrical connections in the city**	202718
		Total electricity supplied to the city (kWh)	531.89
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	2800000
	Roads and Transport	**Total Length of Road Network in the City (Km)**	490.44
		Total length of arterial and sub-arterial road network in the city (Km)	37.62
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	29.1

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population

Pillars of Comprehensive Development	Category	Indicators
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings

Pillars of Comprehensive Development	Category	Indicators
		following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through

Pillars of Comprehensive Development	Category	Indicators
		reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

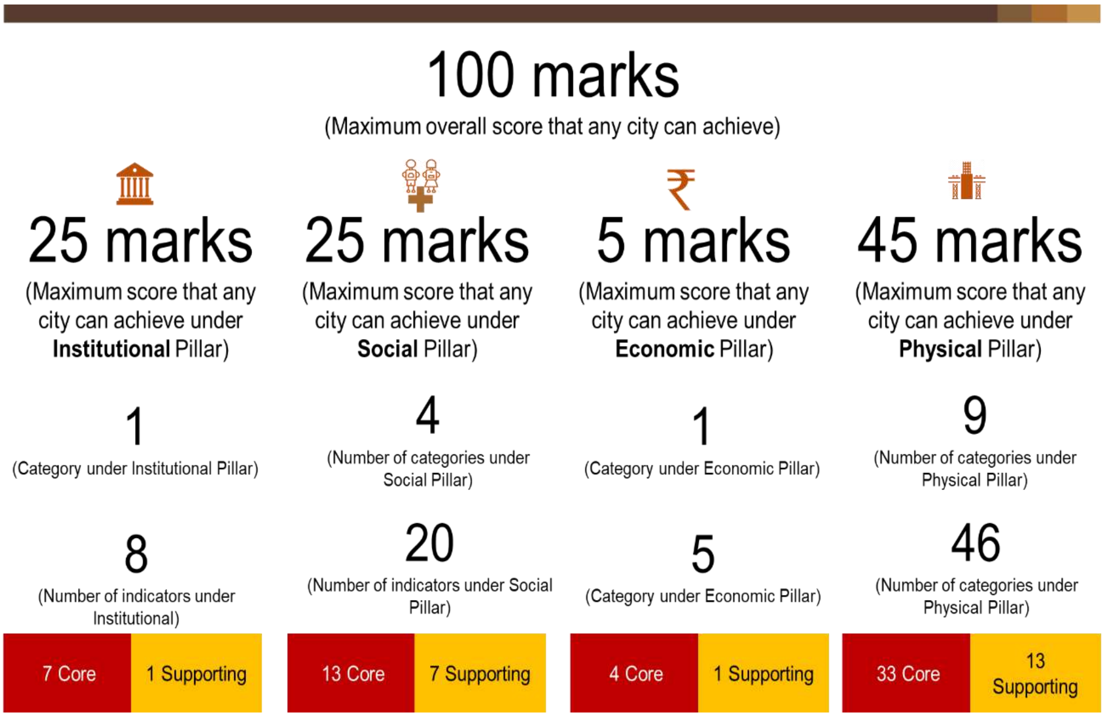
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks	25 marks	5 marks	45 marks
(Maximum score that any city can achieve under **Institutional** Pillar)	(Maximum score that any city can achieve under **Social** Pillar)	(Maximum score that any city can achieve under **Economic** Pillar)	(Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different

categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Section
Urban Local Body	For Park and Recreation Related Questions	Deputy Engineer zone 5 section
Urban Local Body	For Water Supply and Drainage related questions	Deputy Executive Engineer zone 4 section
Urban Local Body	For Heritage sites related data	Assistant City Planner -1
Urban Local Body	For Ecological sites related data	Municipal Engineer zone 4 section
Urban Local Body	For Housing related data	Housing Section
Urban Local Body	For Building plan related data	Town Planning section
Urban Local Body	For Roads related data	Asst Engineer section
Urban Local Body	For Solid waste management related data	Deputy Executive Engineer zone 4 section
Urban Local Body	For IT services related data	VOICE section
Urban Local Body	For Vendor committee related data	UCD Section
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Heads of the Departments
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Pollution Control Board
Development Authority	Building Infrastructure	Tirupati Urban Development Authority Planning section
	Construction planning	Tirupati Urban Development Authority Planning section
	Green Building	Tirupati Urban Development Authority Planning section
	Rain water harvesting	Tirupati Urban Development Authority

Designated data owners	Subcategories	Data owners at city level
		Planning section
	Universal Design Principle	Tirupati Urban Development Authority Planning section
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Southern power/DISCOM, Tirupati
State Disaster management authority		District Disaster Management Authority
State Education Department		Mandal Education Officer (Urban)
State Health Department	Health care professionals	Medical Health Officer
	Citizen Services	Medical Health Officer
	Disease Prevalence	Medical Health Officer
	Health Infrastructure	Medical Health Officer
State Renewable Energy Development Agency	Renewable Energy	Non-Conventional Energy Development Corporation of Andhra Pradesh
State Sales / Commercial Taxes Department		Commercial Tax
Town and Country Planning Department	Land Use	Planning section
Traffic and Police Department		Deputy Superintendent of Police
Transport Authorities	Buses	District Transport Dept-APSRTC
	Registered Vehicles	District Transport
	Sub urban rail transport	No
	Mono Rail Authority	No
	Tramways	No
	Marine Transport Authority	No

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 92 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments.

Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**5**
DISCOM/Electricity Department	**6**
Traffic and Police Department	**20**
Development Authority	**1**
Pollution Control Board	**7**
State Renewable Energy Department	**2**
Town and Country Planning	**1**
State Health Department	**2**
Transport Authority	**2**
Disaster Management	**0**
Urban Local Body	**45**
Total	**92***

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	**Scores in Percentage**
Governance	58.53%
Identity & Culture	60%
Education	96%
Health	99%
Safety & Security	41%
Economy & Employment	42%
Housing & Inclusiveness	1%
Public Open Spaces	41%
Mixed Land Use & Compactness	0%
Power Supply	51%
Transport & Mobility	42%
Assured Water Supply	74%
Waste Water Management	72%
Solid Waste Management	100%
Reduced Pollution	79%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	Challenges	Proposed Solutions
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.

#	Challenges	Proposed Solutions
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.

#	Challenges	Proposed Solutions
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.

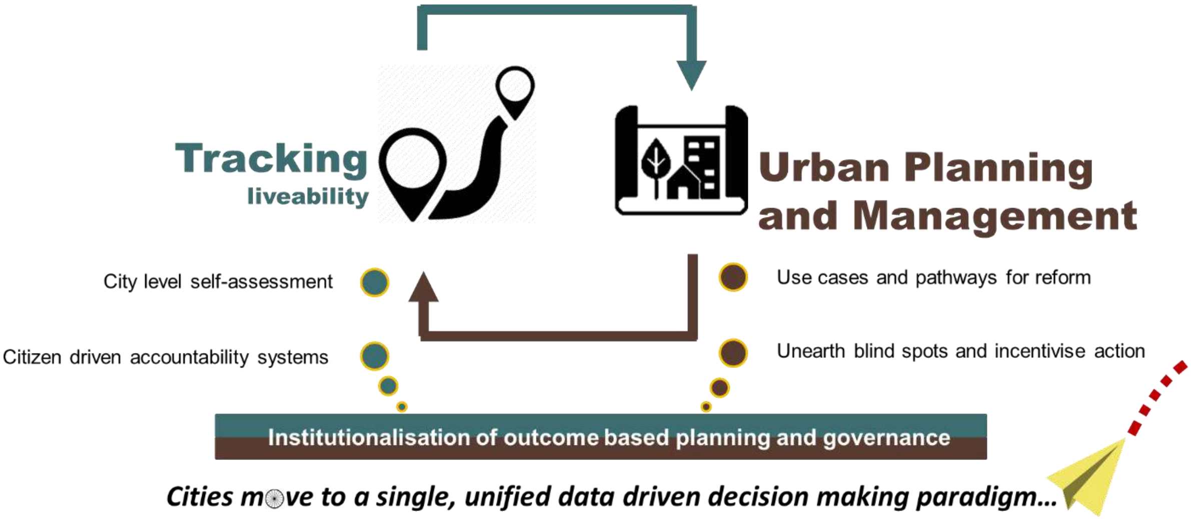
#	Challenges	Proposed Solutions
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).

TIRUPPUR

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	**Total Geographical Area (Km^2)**	159.35	**City Category**	Small City

DEMOGRAPHIC PROFILE

Total Population	444352
Total Number of Households	289235

SOCIAL PROFILE

Education	**Total Number of Schools**	258
	Total Enrolment (Class 1 to 5)	28104
Health	**Total Number of In-patients Beds**	1774
	Total Health Workforce	566
Safety and Security	**Total Strength of Police Force**	655
	Total Number of CCTV Cameras	36
Heritage Sites	**Total Number of Heritage Sites**	0

ECONOMIC PROFILE

Total Population in Working Age Group	865419
Total Number of Industries	12191
Total Number of Commercial Enterprises	8811
Total Number of Hotels	39
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	22977.52
Total VAT Collection in FY 2016-17 (INR Lakhs)	25913.96

PHYSICAL PROFILE			
	Water	**Average Quantity of Water Supplied (MLD)**	125
		Total Number of Water Connections	185349
	Sanitation Facilities	**Total number of households with access to individual toilets in the city**	280170
		Total number of households in the city with access to community toilets in the city	9065
	Solid Waste Management	**Daily average quantity of municipal solid waste collected in the city (Tonnes/day)**	520
		Total number of households covered through door-to-door collection of solid waste	289235
	Waste Water	**Daily Average Quantum of Waste Water Generated in the City (MLD)**	96.28
		Daily average quantum of waste water treated by STPs in the city (MLD)	7
	Electricity	**Total number of authorized electrical connections in the city**	351827
		Total electricity supplied to the city (kWh)	1356742711
	Public and Open Spaces	**Total area covered by green spaces in the city (m^2)**	96842.49
	Roads and Transport	**Total Length of Road Network in the City (Km)**	1332.84
		Total length of arterial and sub-arterial road network in the city (Km)	…
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	1.289

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio

Pillars of Comprehensive Development	Category	Indicators
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services

Pillars of Comprehensive Development	Category	Indicators
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities

Pillars of Comprehensive Development	Category	Indicators
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection

Pillars of Comprehensive Development	Category	Indicators
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.

100 marks

(Maximum overall score that any city can achieve)

25 marks

(Maximum score that any city can achieve under **Institutional** Pillar)

1

(Category under Institutional Pillar)

8

(Number of indicators under Institutional)

7 Core | 1 Supporting

25 marks

(Maximum score that any city can achieve under **Social** Pillar)

4

(Number of categories under Social Pillar)

20

(Number of indicators under Social Pillar)

13 Core | 7 Supporting

5 marks

(Maximum score that any city can achieve under **Economic** Pillar)

1

(Category under Economic Pillar)

5

(Category under Economic Pillar)

4 Core | 1 Supporting

45 marks

(Maximum score that any city can achieve under **Physical** Pillar)

9

(Number of categories under Physical Pillar)

46

(Number of categories under Physical Pillar)

33 Core | 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{indicator\ value\ for\ the\ city - indicator\ value\ for\ the\ worst\ performing\ city}{benchmark - \ indicator\ value\ for\ the\ worst\ performing\ city}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Account Section, Tirupur Municipal Corporation
Urban Local Body	For Park and Recreation Related Questions	Town and country Planning Department Planning Department, Tirupur Municipal Corporation
Urban Local Body	For Water Supply and Drainage related questions	Engineering Department, Tirupur Municipal Corporation
Urban Local Body	For Heritage sites related data	Engineering Department, Tirupur Municipal Corporation
Urban Local Body	For Ecological sites related data	Engineering Department, Tirupur Municipal Corporation
Urban Local Body	For Housing related data	Town and Country Planning Department Planning Department, Tirupur Municipal Corporation
Urban Local Body	For Building plan related data	Town and Country Planning Department Planning Department, Tirupur Municipal Corporation
Urban Local Body	For Roads related data	Tirupur Municipal Corporation
Urban Local Body	For Solid waste management related data	Solid waste management Unit , Tirupur Municipal Corporation
Urban Local Body	For IT services related data	IT Department, Tirupur Municipal Corporation
Urban Local Body	For Vendor committee related data	Tirupur Municipal Corporation
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	Tamil Nadu State pollution control Board
Development Authority	Building Infrastructure	Town and country planning Department Tirupur Municipal Corporation
	Construction planning	Town and country planning Department Tirupur Municipal Corporation
	Green Building	Town and country planning department
	Rain water harvesting	Town and country planning department
	Universal Design Principle	Town and country planning Department

Designated data owners	Subcategories	Data owners at city level
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		Disaster Management – Collector office
State Education Department		District Education Department
State Health Department	Health care professionals	City Health Officer- Tirupur Municipal Corporation
	Citizen Services	City Health Officer- Tirupur Municipal Corporation
	Disease Prevalence	City Health Officer- Tirupur Municipal Corporation
	Health Infrastructure	City Health Officer- Tirupur Municipal Corporation
State Renewable Energy Development Agency		Tamilnadu Electricity Board
State Sales / Commercial Taxes Department		District sales / commercial Tax office, Tirupur
Town and Country Planning Department	Land Use	Town and country Planning Department, Tirupur
Traffic and Police Department		City police commissioner office, Tirupur
Transport Authorities	Buses	Tamilnadu state transport corporation
	Registered Vehicles	Regional Transporting Office, Tirupur
	Sub urban rail transport	
	Mono Rail Authority	
	Tramways	
	Marine Transport Authority	

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 130 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**6**
DISCOM/Electricity Department	**10**
Traffic and Police Department	**4**
Development Authority	**6**
Pollution Control Board	**2**
State Renewable Energy Department	**1**
Town and Country Planning	**2**
State Health Department	**20**
Transport Authority	**8**
Disaster Management	**1**
Urban Local Body	**69**
Total	**130***

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

5 City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	46.49%
Identity & Culture	18%
Education	90%
Health	93%
Safety & Security	64%
Economy & Employment	32%
Housing & Inclusiveness	12%
Public Open Spaces	1%
Mixed Land Use & Compactness	8%
Power Supply	47%
Transport & Mobility	18%
Assured Water Supply	87%
Waste Water Management	61%
Solid Waste Management	67%
Reduced Pollution	75%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt “outcome based” approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.

Nodal agency at state level supported by the City and State Coordinator and city level (Municipality corporation/smart city limited) coordinated with city specific data owners/departments for data gathering, collation, and submission. Nodal persons in each department were appointed for timely data collection and submission. Of 116, 112 cities submitted data as per the timeline on 16th April 2018.

Post submission, the city and state coordinators supported by the central team followed up extensively with the cities to support secondary documents as evidence to substantiate their submissions. Secondary documents such as reports, official orders, copy of office register, signed copy of liveability assessment questionnaire furnished by cities against the submitted data. Documents are verified to map the documents for the reponses provided by city and to check the type data provided by city. The document check outcomes were shared with the cities as a part of data quality check.

For checking consistency of data, logical check of data, verifying data from other public sources were undertaken. Quality check was done to ensure data validity and provide opportunity to cities to review the data provided by them and correct in case of wrong data entry.

For 8 selected indicators namely, percentage of services integrated through command and control center, hotel occupancy rate, percentage of schools with access to digital education, number of CCTV cameras per unit road length, percentage of vendors registered and provided formal spaces, availability of passenger information system, percentage of traffic intersection with pedestrian crossing facility, and extent to which universal accessibility is incorporated in public rights of way. Physical audit was conducted in 110 cities by physical auditors appointed and trained by the consortium. In consultation with ULB nodal person, locations and indicators for physical audit was selected in each city. A mobile based application was developed to capture the physical audit related data.

Primary data collection was done for five indicators such as unemployment rates, mode share of public transport, mode share of non-motorized transport, quality of water supplied, and level of noise pollution. Protocols for water and noise test were prepared in consultation with experts. Water quality test involved physical, chemical and bacteriological test of water as per the CPCB norms. For testing quality of water at consumer end, the auditors worked closely with the ULB and Water department. Samples were collected from consumer end and submitted to the lab suggested by city. For noise pollution, in about 20 cities the state pollution board or city level

environment department took the responsibility for providing noise pollution data as per the protocols. In rest of the cities, mobile based application was used to measure noise pollution.

During implementation, MoHUA facilitated the process by conducting video conferences with cities to address any queries, reiterate the importance, and ensure that cities adequately engages in the process and submit their responses in time and respond to requests for clarifications.

In addition to secondary data collection, physical audit and primary data collection, citizen survey was conducted to understand their perception and level of satisfaction on various services such as health, education, water supply, electricity, waste management etc. provided by urban local bodies. Over 60000 citizens participated in the survey across India.

The final scores and ranks have been generated based on the scoring methodology that has been discussed extensively and minor modifications made that are summarized as below:

#	**Challenges**	**Proposed Solutions**
1	Only 23 cities of 111 cities have City Mobility Plan (CMP) or any and hence able to provide data for Mode Share of Public Transport and Non-Motorised Transport. To address the data gap, as advised by the MoHUA, the consortia undertook a sample dipstick across all cities covering a sample of 150 Households. Understandably, the dipstick findings will not match the rigor of a CMP.	We recommend the following: 1) Cities which have provided CMP Data will be evaluated on 100% of the maximum score 2) For the cities where the dipstick data is used, the city receives a 50% discount on the overall score Alternatively, another approach is to assign 0 score to all 88 cities that don't have a CMP
2	Variance was observed on data reported by cities on road network and data presented in the smart city proposals during the verifications.	We recommend taking the data reported by the cities in the Smart City Proposals.

#	Challenges	Proposed Solutions
3	There is no secondary source/ organization that provides unemployment data at city level. As a result, most cities do not have the data. Fully cognizance of the challenges of generating this data in a short span of time, it was agreed to collect this data through a dipstick survey on lines of NSSO questions. The data generated needs further scrutiny and triangulation with some inputs from experts. This may not be possible in the short window.	The indicator on unemployment will be excluded from scores. For final ranking, the cities will be scored on 78 indicators.
4	Many cities did not have data on noise pollution and it was decided that data will be collected using a mobile app for all the 111 cities. However, many cities have expressed reservations with the approach especially with respect to the reliability of using this data. Further, some cities have relied on the SPCB to collect the data as per the approach proposed by the consortia. Thus, noise pollution data is currently from two sources: 1. SPCB- 20 cities 2. Noise-based app- 91 cities	The data collected through the primary survey will be used for scoring the cities. Currently, there is no differential scoring for the data from the SPCB and the data collected through the mobile app. However, a certain higher weightage can be provided to those cities which used the state apparatus to collect noise pollution data.
5	For the indicator on quality of water supplied, the methodology document states that samples should be drawn both at the treatment plant outlet as well as the consumer end. However, the data provided by the cities were predominantly from the distribution point. Hence for consumer end results with MoHUA intervention, consortia coordinated with cities to collect the data at the consumer end. The cities facilitated the testing. The outcome of the process is as below: 1. Sample given- 102 cities 2. Report received- 86 cities 3. Report awaited- 16 cities 4. Tests not completed due to lack of cooperation and other reasons – 9	The maximum score for this indicator will be distributed equally (50%) for results based on samples from the treatment plant and consumer end. Cities that did not complete tests or provide the results will be given a score 0 for against consumer end tests.

#	Challenges	Proposed Solutions
6	City level population is not projected annually by most of the cities. So, estimates for 2017 population are not available with the cities.	As recommended by MoHUA, 2011 census population is being used for the ranking purpose.
7	The age category specific data for 9 cities is not available at a city level	The age category specific population data has been taken at a district level for these cities.
8	Indicators on non-motorised transports like- Dedicated bicycle tracks, bicycle parking facilities and mode share of non-motorised transport are not relevant for hilly terrains.	As discussed during the PMC meeting, these indicators have been treated as non-applicable for the hilly cities and the weights have been redistributed among other indicators within the same category.
9	The indicator on increase in professional tax is not relevant to cities which do not levy the professional tax.	As discussed during the PMC meeting, this indicator has been non-applicable to the cities belonging to states where professional tax is not levied, and the weights have been redistributed among other indicators within the same category.
10	The indicator on increase in VAT collection is not applicable to Port Blair and Kavaratti, as there was no provision of VAT collection in these cities.	As discussed during the PMC meeting, these indicatosr has been treated as non-applicable for these two cities and the weights have been redistributed among other indicators within the same category.

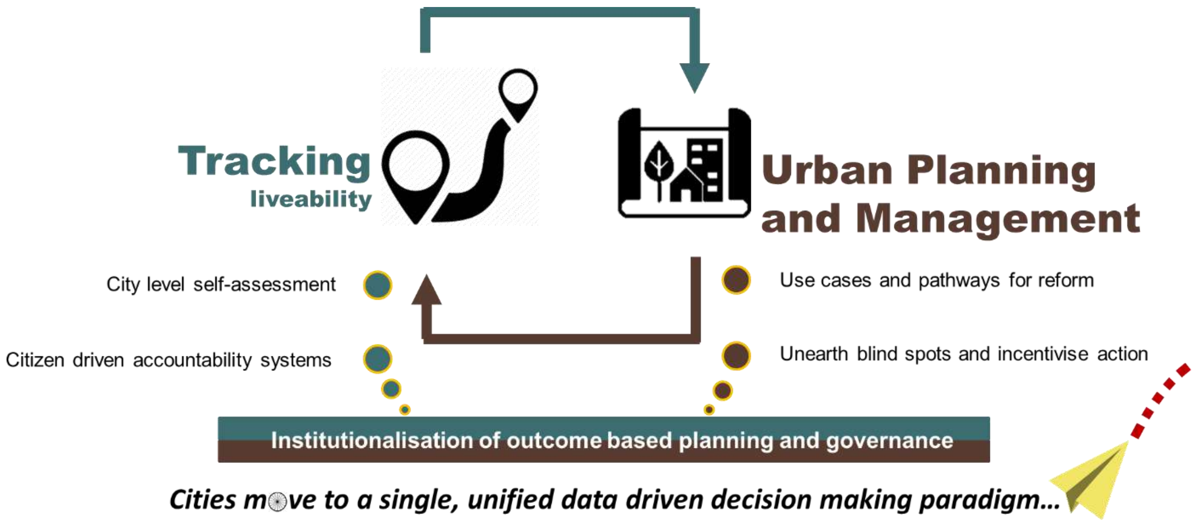
#	Challenges	Proposed Solutions
11	Indicator on coverage of basic services to slum households does not concern cities with no slums (notified/ non-notified.	As discussed during the PMC meeting, this indicators has been treated as non-applicable for these cities and the weights have been redistributed among other indicators within the same category.

1. Introduction

The Ministry of Housing and Urban Affairs (MoHUA) is implementing several flagship urban missions such as the Smart Cities Mission (SCM), Atal Mission for Urban Rejuvenation and Transformation (AMRUT), Heritage City Development and Augmentation Yojana (HRIDAY), Housing for All (HFA). Theses mission along with other transformative initiatives of the Government including National Water Mission, Power for All, National Health Mission are aimed at making Indian cities more 'liveable.' The overarching goal of these initiatives is to move from an input-based approach to a 'citizen centric-outcome based' assessment of urban liveability.

To develop a common minimum framework for cities to assess their existing status and chart their pathway towards providing a better quality of life to their citizens, the MoHUA developed a set of 'Liveability Standards' relevant to cities to generate a Liveability Index and ranking of cities. These standards were launched in June, 2017. The MoHUA has planned to conduct an 'Annual Assessment of Liveability Standards in Cities – an ambitious national project that will involve yearly submission of data by cities across the various indicators, compilation and analysis, development of indices and ranking of cities. The Liveability Index is envisioned as a 360° tool for tracking, planning and transforming Indian cities. The Liveability Index is aimed at the following objectives:

- Providing strong evidence-based approach for future interventions and investments to deliver liveability outcomes
- Catalysing actions to improve the overall quality of the city's liveability and achieve broader development outcomes including the Sustainable Development Goals
- Assessing the implementation of government policies and schemes governing characteristics of cities that can contribute to creating liveable communities



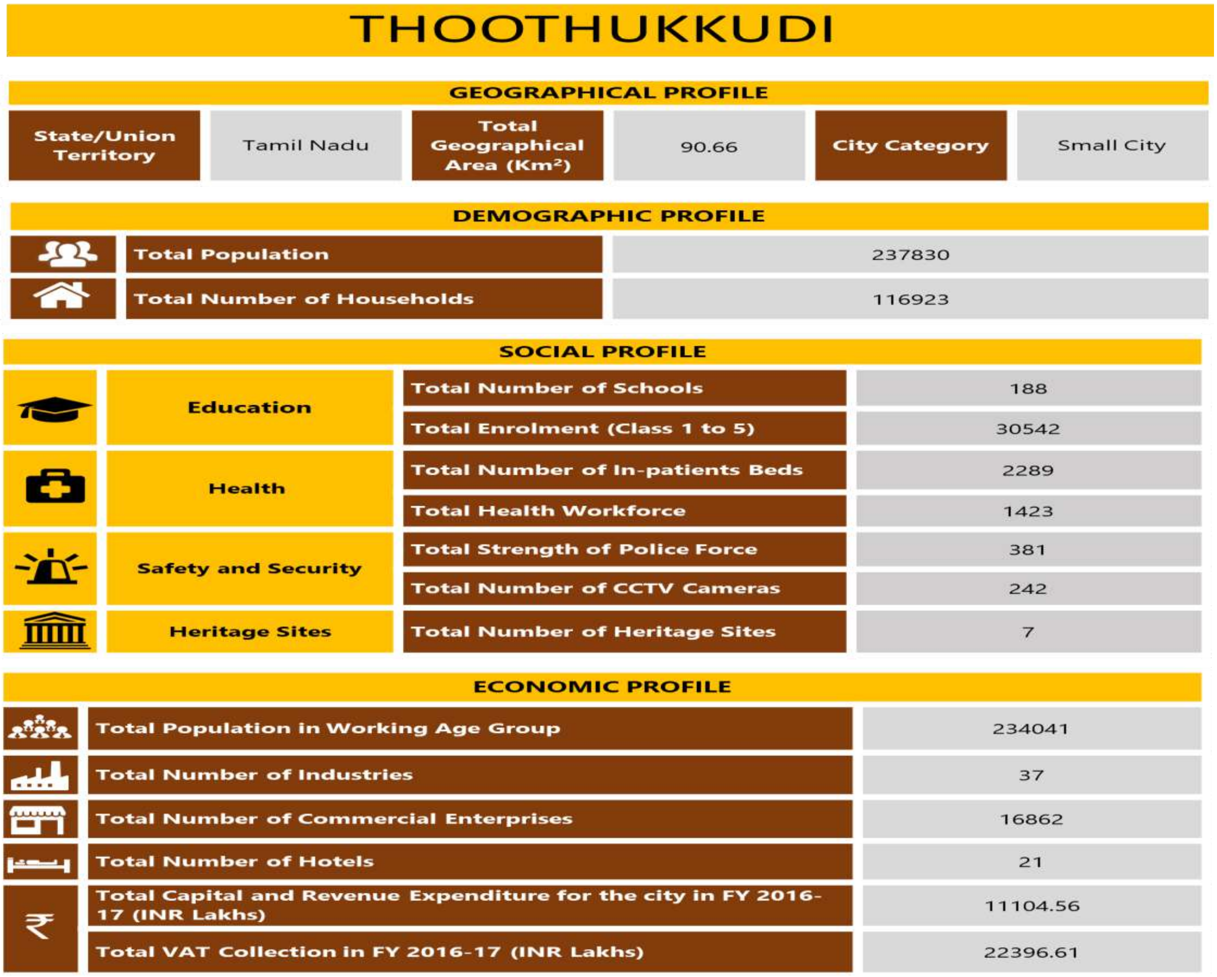
Tracking
liveability
Urban Planning
and Management
City level self-assessment
Citizen driven accountability systems
Use cases and pathways for reform
Unearth blind spots and incentivise action
Institutionalisation of outcome based planning and governance

Cities move to a single, unified data driven decision making paradigm…

The first round of the assessment commenced in January 2018 covering 116 major cities including smart cities, capital cities and cities with population of above one million each. Implementation of the liveability assessment commenced in January 2018 with a national level orientation workshop for the urban local bodies. The workshop aimed at orienting the states and urban local bodies on the overall framework, indicators, data sources, methodology and key milestones and timelines involved in the liveability assessment. Subsequently, a series of State/ Union Territory level orientation workshops were carried out in 33 states/UTs for a detailed discussion on the framework. Online data collection commenced from 9th March through an online data collection platform that supported both online and offline data submission modes. On the date of closure of the online data entry portal i.e., 16th April, 2018 112 cities submitted their data. Subsequently, comprehensive checks on the submitted data was undertaken that involved checking for outliers, logical inconsistencies etc. post which round-1 of data reconciliation was conducted. This draft report is based on round-1 of reconciled data as on 28th April, 2018.

2. City Profile

This chapter presents the city profile -Geographic and Demographic, Social (Education Health, Safety and Security, Heritage), Economic profile, and Physical (Water, sanitation and Waste Management, Electricity, Open space and roads).



THOOTHUKKUDI

GEOGRAPHICAL PROFILE

State/Union Territory	Tamil Nadu	Total Geographical Area (Km²)	90.66	City Category	Small City

DEMOGRAPHIC PROFILE

Total Population	237830
Total Number of Households	116923

SOCIAL PROFILE

Education	Total Number of Schools	188
	Total Enrolment (Class 1 to 5)	30542
Health	Total Number of In-patients Beds	2289
	Total Health Workforce	1423
Safety and Security	Total Strength of Police Force	381
	Total Number of CCTV Cameras	242
Heritage Sites	Total Number of Heritage Sites	7

ECONOMIC PROFILE

Total Population in Working Age Group	234041
Total Number of Industries	37
Total Number of Commercial Enterprises	16862
Total Number of Hotels	21
Total Capital and Revenue Expenditure for the city in FY 2016-17 (INR Lakhs)	11104.56
Total VAT Collection in FY 2016-17 (INR Lakhs)	22396.61

PHYSICAL PROFILE			
	Water	Average Quantity of Water Supplied (MLD)	35
		Total Number of Water Connections	51180
	Sanitation Facilities	Total number of households with access to individual toilets in the city	80165
		Total number of households in the city with access to community toilets in the city	2479
	Solid Waste Management	Daily average quantity of municipal solid waste collected in the city (Tonnes/day)	155
		Total number of households covered through door-to-door collection of solid waste	104564
	Waste Water	Daily Average Quantum of Waste Water Generated in the City (MLD)	...
		Daily average quantum of waste water treated by STPs in the city (MLD)	...
	Electricity	Total number of authorized electrical connections in the city	164953
		Total electricity supplied to the city (kWh)	319.9044
	Public and Open Spaces	Total area covered by green spaces in the city (m^2)	58827
	Roads and Transport	Total Length of Road Network in the City (Km)	607.85
		Total length of arterial and sub-arterial road network in the city (Km)	...
		Total length of footpath (wider than 1.2 metres) in the city along the street network (Km)	4.5

3. Liveability Framework and Indicators

The Liveability Framework comprises a total of 79 indicators (57 Core Indicators and 22 Supporting Indicators). A core indicator carries 70% weightage and a supporting indicator carries 30% weightage. These indicators are grouped under 15 thematic categories which in turn are part of four pillars of comprehensive development of cities i.e., institutional, social, economic and physical. Based on the performance of cities against the various core and supporting indicators, various 'Category Sub-Indexes' and a composite 'City Liveability Index' will be developed for each city.

3.1 Scoring and Computing Category Indices of Liveability

The set of 79 indicators, associated categories and pillars are presented in the table below:

Table 1 List of Pillars, Categories and Indicators

Pillars of Comprehensive Development	Category	Indicators
Institutional	1. Governance	1.1 Percentage of citizen services available online
		1.2 Percentage of services integrated through Command Centre
		1.3 Percentage of citizens using online services
		1.4 Average delay in grievance redressal
		1.5 Tax collected as percentage of tax billed
		1.6 Extent of cost recovery (O&M) in water supply services
		1.7 Capital spending as percentage of total expenditure
		1.8 Percentage of population covered under Ward Committees/Area *Sabhas*
Social	**2. Identity and Culture**	2.1 Restoration and reuse of historic buildings
		2.2 Percentage of ecologically important areas covered through projects for restoration
		2.3 Hotel occupancy
		2.4 Percentage of budget allocated towards cultural/sports activities
		2.5 Number of cultural/sports events hosted by city
	3. Education	3.1 Percentage of school-aged population enrolled in schools
		3.2 Percentage of female school-aged population enrolled in schools
		3.3 Primary education student-teacher ratio
		3.4 Percentage of schools with access to digital education
		3.5 Percentage of students completing primary

Pillars of Comprehensive Development	Category	Indicators
		education
		3.6 Percentage of students completing secondary education
	4. Health	4.1 Number of in-patient hospital beds per 10,000 population
		4.2 Healthcare professionals per 10,000 population
		4.3 Average response time in case of health emergencies
		4.4 Period prevalence of water borne diseases
		4.5 Period prevalence of vector borne diseases
	5. Safety and Security	5.1 Number of CCTV Cameras
		5.2 Number of recorded crimes per lakh population
		5.3 Extent of crimes recorded against women, children and elderly per year
		5.4 Transport-related fatality per lakh population
Economic	**6. Economy and Employment**	6.1 Increase in VAT/GST collection
		6.2 Increase in collection of Professional Tax
		6.3 Increase in issuance of Construction permits
		6.4 Unemployment rate
		6.5 Percentage of vendors registered and provided formal spaces
Physical	**7. Housing and Inclusiveness**	7.1 Percentage of Slum/EWS households covered through formal/affordable housing
		7.2 Percentage of slum areas covered through basic services
	8. Public Open Spaces	8.1 Per capita availability of green spaces
		8.2 Per capita availability of public and recreational

Pillars of Comprehensive Development	Category	Indicators
		places
	9. Mixed Land Use and Compactness	9.1 Share of mixed land use area in overall city land use
		9.2 Net Density
	10. Power Supply	10.1 Percentage of city population with authorized electrical services
		10.2 Percentage of electrical connections covered through smart meters
		10.3 Average number of electrical interruptions per year
		10.4 Average length of electrical interruptions per year
		10.5 Percentage of total energy derived from renewable sources
		10.6 Energy consumption per unit - water supply and sewerage
		10.7 Energy consumption per unit - street lighting
		10.8 Percentage of new and redeveloped buildings following green building norms
		10.9 Total energy consumption per capita
	11. Transportation and Mobility	11.1 Geographical coverage of public transport
		11.2 Availability of public transport
		11.3 Mode share of public transport
		11.4 Percentage of road network with dedicated bicycle tracks
		11.5 Percentage of interchanges with bicycle parking facilities
		11.6 Mode share of non-motorized transport
		11.7 Availability of Passenger Information System

Pillars of Comprehensive Development	Category	Indicators
		11.8 Extent of signal synchronization
		11.9 Availability of paid parking spaces
		11.10 Percentage coverage of footpaths – wider than 1.2 m
		11.11 Percentage of traffic intersections with pedestrian crossing facilities
		11.12 Extent to which universal accessibility is incorporated in public rights-of-way
	12. Assured Water Supply	12.1 Household level coverage of direct water supply connections
		12.2 Per capita supply of water
		12.3 Quality of water supplied
		12.4 Level of non-revenue water – NRW
		12.5 Percentage of water connections covered through meters
		12.6 Percentage of plots with rainwater harvesting facility
	13. Waste Water Management	13.1 Coverage of toilets
		13.2 Coverage of sewerage network and/or septage
		13.3 Collection efficiency of sewerage network
		13.4 Extent of reuse and recycling of waste water
		13.5 Coverage of storm water drains
	14. Solid Waste Management	14.1 Household level coverage of municipal solid waste collection
		14.2 Efficiency of collection of municipal solid waste
		14.3 Extent of municipal solid waste recovered through reuse

Pillars of Comprehensive Development	Category	Indicators
	15. Reduced Pollution	15.1 Concentration of SO2- air pollution
		15.2 Concentration of NO2- air pollution
		15.3 Concentration of PM10 - air pollution
		15.4 Level of noise pollution
		15.5 Quality of water in public surface water bodies

3.2 Scoring and Computing Category Indices of Liveability

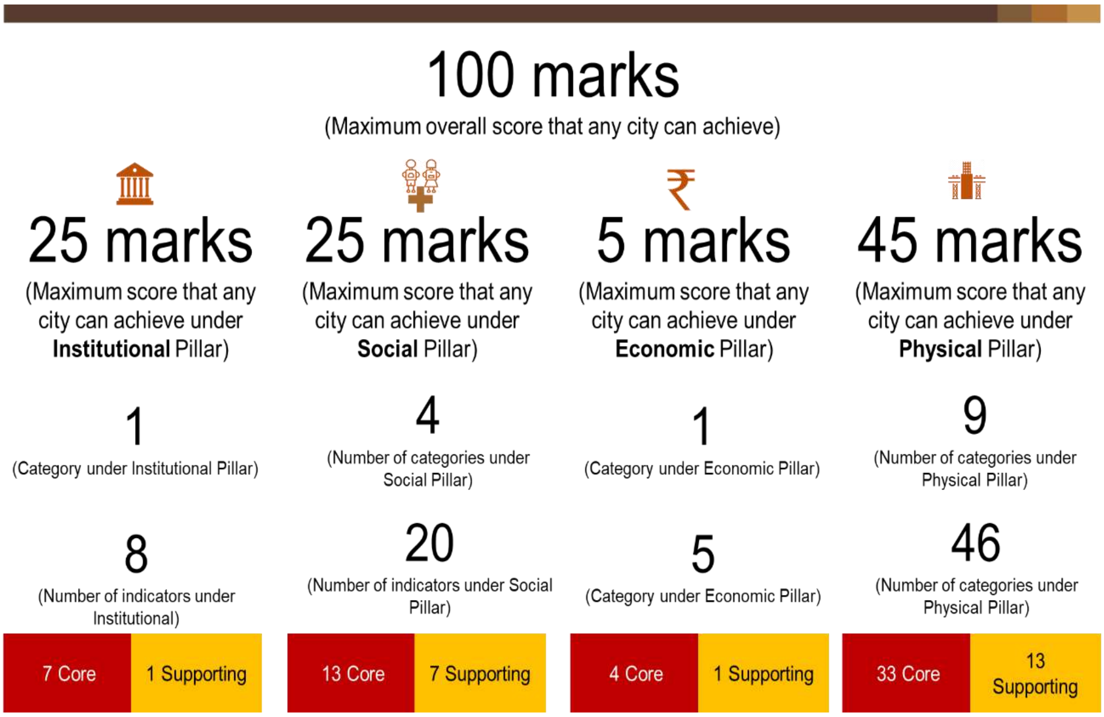
The performance achieved by cities against 79 indicators, will be assessed against given benchmarks. Where no international/national norms are available, city with the best performance in its group (population range) will be treated as a benchmark. The groups are given in the table below.

Table 2 Details on Population Range

Category	Population range
Category 1	Population ≥ 4 million
Category 2	1 million ≤ Population < 4 million
Category 3	0.5 million ≤ Population < 1 million
Category 4	Population < 0.5 million

3.3 Scoring Approach and Methodology

A city can earn a maximum score of 100 points for 79 indicators across four pillars. The pillar weights are as follows: Institutional (25 points), Social (25 points), Economy and Employment (5 points) and Physical (45 points). Based on the number and nature of indicators i.e., core vs. secondary, indicator wise maximum marks were computed.



100 marks

(Maximum overall score that any city can achieve)

25 marks (Maximum score that any city can achieve under **Institutional** Pillar)	25 marks (Maximum score that any city can achieve under **Social** Pillar)	5 marks (Maximum score that any city can achieve under **Economic** Pillar)	45 marks (Maximum score that any city can achieve under **Physical** Pillar)
1 (Category under Institutional Pillar)	4 (Number of categories under Social Pillar)	1 (Category under Economic Pillar)	9 (Number of categories under Physical Pillar)
8 (Number of indicators under Institutional)	20 (Number of indicators under Social Pillar)	5 (Category under Economic Pillar)	46 (Number of categories under Physical Pillar)
7 Core 1 Supporting	13 Core 7 Supporting	4 Core 1 Supporting	33 Core 13 Supporting

Dimensional Index Methodology (DIM) has been used to compute scores for each indicator with reference to “maximum within the comparison group” or “absolute benchmarks”. For indicators where benchmarks are available, cities getting the benchmark score (or above) are given the maximum mark, and the marks awarded to other cities are calculated proportionately. For indicators where benchmarks are not available, the best performing cities in each population group are given the maximum mark, and the marks awarded to other cities (within the population group) are calculated proportionately. For indicators where benchmarks do not exist, the city data has been tested for outliers before scoring. The list of benchmarks is presented in Annexure 1.

3.4 Scoring Normalisation:

To construct aggregate scores across cities as well as to make the scores across indicators comparable, indicator values were normalised using a min-max approach. The following formula was used to normalise the indicator values-

$$\frac{\textit{indicator value for the city} - \textit{indicator value for the worst performing city}}{\textit{benchmark} - \textit{indicator value for the worst performing city}}$$

This approach would restrict the normalised indicator value between 0 and 1. Cities that met or exceeded the benchmark received a normalised indicator value of 1. Worst performing cities are given a normalised indicator value of 0. After normalisation, the normalised value is weighted according to the category and the indicator being core or supporting.

To illustrate, consider the indicator 12.3 Quality of Water Supplied in the Category 12 for Assured Water Supply. If in City A 50% of the water samples collected qualify the potable water standards specified by the CPHEEO, and only 10% of the samples from worst performing city qualify the standards. Then, the normalised value for the indicator for city A would be 0.44 [(0.5-0.1)/(1-0.1)].

The weight for indicator 12.3 is 1.03, so the final weighted score for City A would come out to 0.45 [1.03*0.44].

4. Data Collection and Verification

4.1 Submission of Data by the cities

The Liveability Assessment is based on secondary data submitted by the urban local bodies and other concerned government agencies (collectively called as data owners). The 79 indicators were broken down into a set of easy to understand and relatable 553 questions mapped to data owners. Submission of the data was enabled through an online data entry portal on the smartnet platform of the Ministry. The portal also allowed the ULBs to download the liveability assessment questionnaire and upload filled in questionnaire. To familiarise and assist cities in identifying, mapping and collation of data points, a city level nodal person was available during the entire period of data submission process.

4.2 Mapping of Data Owners for the City

For the assessment of liveability indices broadly 12 data owners such as Central/state Pollution control board, Development authority, DISCOM/Electricity Board, State Disaster Management Authority, State Education Department, State Health department, State Renewable energy and development agency, State sales and commercial taxes department, town and country planning

department, Traffic and police department, Transport authority, and Urban local body were identified to respond to the questions on the portal. However, during state workshop and subsequent city level discussions, more data owners were mapped to respond to different categories and sub categories. The following table provides the details of city level data owners mapped under the 12 data owner.

Table 3:Details of Data Owners

Designated data owners	Subcategories	Data owners at city level
Urban Local Body	For Accounts Related Questions	Accounts Section-Urban Local Body
Urban Local Body	For Park and Recreation Related Questions	Urban Local Body
Urban Local Body	For Water Supply and Drainage related questions	Water Supply section-Urban Local Body
Urban Local Body	For Heritage sites related data	Not Applicable
Urban Local Body	For Ecological sites related data	Urban Local Body
Urban Local Body	For Housing related data	Slum Clearence Board-Tirunelveli
Urban Local Body	For Building plan related data	Town Planning-Urban
Urban Local Body	For Roads related data	Urban Local Body
Urban Local Body	For Solid waste management related data	Urban Local Body
Urban Local Body	For IT services related data	Urban Local Body
Urban Local Body	For Vendor committee related data	Urban Local Body
Urban Local Body	Any other departments involved in providing data for questions mentioned under Urban Local Body	Urban Local Body
Central / state Pollution control Board	Water Quality, Air Quality, Noise Quality	State Pollution Control Board
Development Authority	Building Infrastructure	Urban Local Body
	Construction planning	Urban Local Body

Designated data owners	Subcategories	Data owners at city level
	Green Building	Urban Local Body
	Rain water harvesting	Urban Local Body
	Universal Design Principle	Urban Local Body
DISCOM/Electricity Board	Electrical Connection/ Grievance Redressal/ Power supply	Tamilnadu Electricity Board
State Disaster management authority		State Disaster Management Authority
State Education Department		Education Department
State Health Department	Health care professionals	Urban Local Body
	Citizen Services	Urban Local Body
	Disease Prevalence	Urban Local Body
	Health Infrastructure	Urban Local Body
State Renewable Energy Development Agency		Tamilnadu Electricity Board
State Sales / Commercial Taxes Department		Tax Department
Town and Country Planning Department	Land Use	Local Planning Authority
Traffic and Police Department		Police Department
Transport Authorities	Buses	TamilNadu State Transport Corporation
	Registered Vehicles	Road Transport Authority
	Sub urban rail transport	Not Applicable
	Mono Rail Authority	Not Applicable
	Tramways	Not Applicable
	Marine Transport Authority	Not Applicable

4.3 List of secondary documents available as supportive

City has provided supporting documents/evidences against the responses given by city on the online portal. In support of their responses on the portal, city submitted 170 number of documents. Documents submitted includes reports, official orders, copy of data maintained in official register, signed copy of questionnaire, and signed letters/submissions from concern departments. Verification includes mapping of documents against responses given by city, checking the type/category of documents, and validation of data provided.

The following table presents the data owner wise number of documents:

Table 4: Data owner wise number of secondary documents submitted by city

Data Owners	Number of Documents
Sales and Commercial Taxes	**1**
State Education Department	**1**
DISCOM/Electricity Department	**8**
Traffic and Police Department	**8**
Development Authority	**2**
Pollution Control Board	**3**
State Renewable Energy Department	**3**
Town and Country Planning	**3**
State Health Department	**8**
Transport Authority	**7**
Disaster Management	**1**
Urban Local Body	**125**
Total	**170***

* The count of documents is based on first round of submission.

4.4 Data Verification

A three-stage data quality check comprising verification of data against secondary documents furnished by data owners, logical inconsistency checks including outliers, and physical audit for select indicators (Refer the exhibit below) is being undertaken. The objective of the data quality check is to ensure that data from the source documents are accurate and verifiable. Sources of data included reports, administrative data, survey results and other statistical records, log books among other.

Physical audit of eight indicators – one indicator from the Institutional pillar, one from the Social pillar, one from the Economy pillar and five from the Physical pillar is also being carried out by the field team to ascertain the degree of reliability of data reported by the cities. The list of these eight indicators is presented below:

1.2 | Percentage of services integrated through Command Centre

2.3 | Hotel occupancy

3.4 | Percentage of schools with access to digital education

5.1| Number of streets, public places, junctions covered through surveillance systems

6.5 | Percentage of vendors registered and provided formal spaces

11.7 | Availability of Passenger Information System

11.11 | Percentage of traffic intersections with pedestrian crossing facilities

11.12 | Extent to which universal accessibility is incorporated in public rights-of-way

For a set of five indicators namely, unemployment rate, mode share of public transport, mode share of non-motorised transport, quality of water supplied and level of noise pollution, existing datasets were found to be not available consistently across all cities and/or were inadequate. To help cities that do not have data on these five indicators, dipstick assessments are being carried to fill data gaps.

6.4 | Unemployment Rate

11.3 | Mode share of public transport

11.5 | Mode share of Non Motorized Transport

12.3 | Quality of Water Supplied

15.4 | Level of Noise Pollution

4.5 Physical Audit

The following map presents the indicators audited at city level.

2. City Score on 15 categories of Assessment

Liveability Assessment covered 15 categories and 78 indicators. The below table presents the scores for all 15 indicators namely governance, identity & culture, education, health, safety and security, economy & employment, housing & inclusiveness, public open spaces, mixed land use & compactness, power supply, transport & mobility, assured water supply, waste water management, solid waste management and reduced pollution.

Table 5: Category wise scores

Categories	Scores in Percentage
Governance	50.47%
Identity & Culture	15%
Education	91%
Health	99%
Safety & Security	67%
Economy & Employment	25%
Housing & Inclusiveness	18%
Public Open Spaces	3%
Mixed Land Use & Compactness	0%
Power Supply	51%
Transport & Mobility	20%
Assured Water Supply	68%
Waste Water Management	31%
Solid Waste Management	66%
Reduced Pollution	81%

The rank of the city is based on the performance and scores in each of the category. The final city rank is submitted separately.

Executive Summary

Assessment of liveability indices is an initiative by the Ministry of Housing and Urban Affairs to improve quality of life of citizens and achieve sustainable development goals by encouraging cities to adopt "outcome based" approach for urban planning. Assessment process aimed to provide opportunity to cities to review the development components holistically by involving 79 measurable indicators categorized under governance, health, education, safety, economy, power supply, transportation and mobility, identity, culture, housing, waste management and pollution.

This report highlights the assessment process, key milestones, and the final outcome of the data submitted. Implementation of liveability assessment commenced formally on 19th January 2018. A national level workshop was organized on 13th February 2018 to explain the importance and process of liveability assessment and get feedback on methodology from the city authorities.

This was followed by the next stage of Questionnaire development. The questionnaire was arranged under 12 categories representing 12 data owners namely urban local body, Central and state pollution control board, development authority, DISCOM/Electricity board, State disaster management authority, state education department, state health department, state renewable energy development agency, state sales and commercial taxes department, town and country planning department, traffic and police department and transport authorities.

An online data entry portal was developed to facilitate data submission by the cities. Each city had a unique log in to access the portal and submit the data. Both online and off-line options (download the questionnaire in an excel) to submit the data were available for cities. An email help desk was set up for the cities to raise any queries and seek clarification when responding to the questions.

A team for each state comprising of State Coordinator and City Coordinator (one per city) was deployed that facilitated the process and supported the cities. A total of 6 regional coordinators/ consultants, 29 State Coordinators, and 99 city coordinators were deployed across 116 cities. Training for state coordinators was held from 26th to 28th February 2018 at Chennai to make coordinators understand overall liveability assessment, indicators, data sources, protocols and roles and responsibilities.

City Reconnaissance Meetings were initiated by the state and city coordinators. The discussion began with discussions to finalize the state workshop schedule, mapping of data owners, and assist cities in data collection. The City Coordinators were based in the cities for over 6 weeks and during this time, they liase with ULB and other data owners to explain the liveability framework, online portal, and facilitate the online submission.

A total of 33 state workshops were conducted at the state level. The objective of the workshop was to orient the city stakeholders on liveability assessment, indicators, components of data

collection, timelines, expectations of support and support extended by MoHUA. The state level workshops brought various city level departments on a single platform to understand and discuss the methodology and components of city liveability assessment.
